1 Overview

This annual report reflects the requirements of the Nitrate Compliance Action Plan (CAP) developed by Line Creek Operations (LCO). The CAP focuses on the critical control strategies for managing nitrate and was submitted to the Ministry of Environment and Climate Change Strategy (ENV) on September 14, 2017. This plan was developed to address the nitrate non-compliances of Permit 107517 (Permit) under the provisions of the *Environmental Management Act*. Permit was issued on November 19, 2014 and was amended on June 5, 2017.

The permit nitrate limits for the compliance point CP-E297110 are 7 mg/L monthly average and 9 mg/L daily maximum. These limits have been in effect since December 31, 2015 as per section 2.3.1 of Permit 107517 and were based on water quality model projections used to support the development of the Elk Valley Water Quality Management Plan (EVWQP).

In 2017, 41 out of the 54 samples taken exceeded the daily maximum nitrate concentrations. The monthly average nitrate concentrations exceeded Permit Limits 11 out of 12 times (Figure 1 and Figure 2).

Figure 1: Monthly Average Nitrate Concentration (mg/L) at the LCO Compliance Point (E297110)

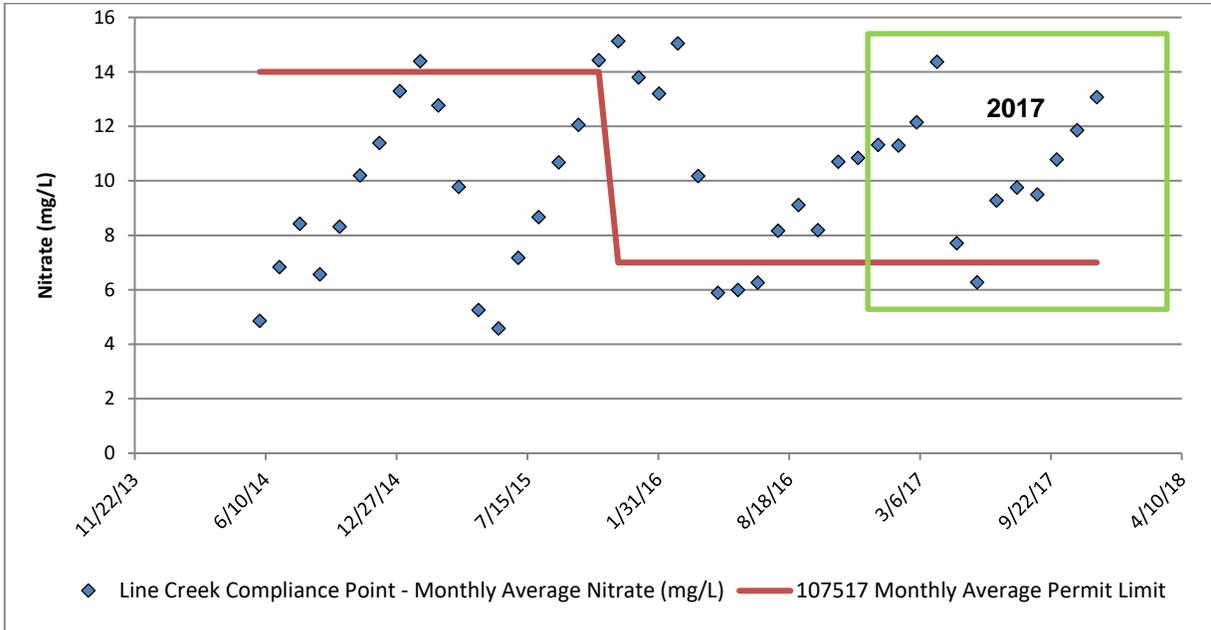

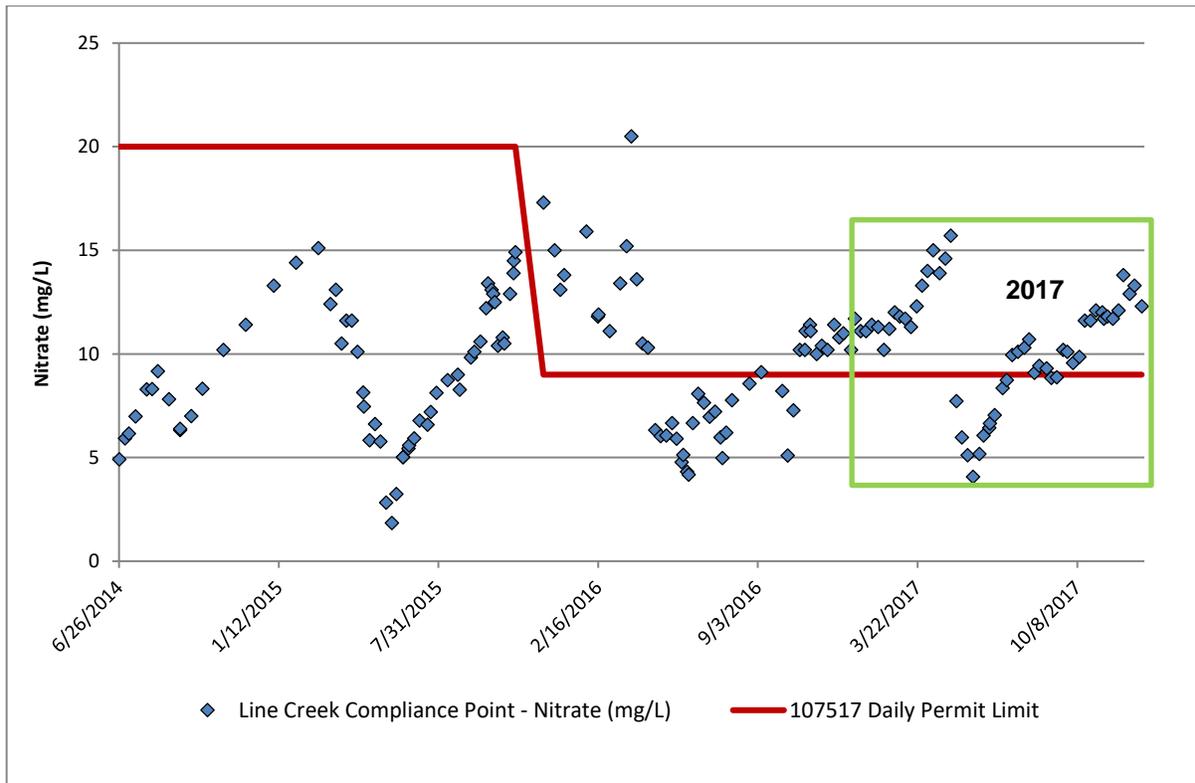

Figure 2: Daily Nitrate Concentration (mg/L) at the LCO Compliance Point (E297110)

2 Progress Summary

A summary of the actions and deliverables listed in the CAP are presented in Table 1. Where applicable, additional information is provided in the “*Additional Comments*” section below.

Table 1: LCO Nitrate Compliance Action Plan—Progress to date

Action	KPI	Results	Comments
Load dry blasting product (ANFO) in blast holes where possible	ANFO Average: Q4 2017 - 30% 2018 - 35%	ANFO Average: Q4 2017- 34%	October – 30% November – 31% December – 43% (2.1.1)
Acquire an additional dewatering truck	New dewatering truck on site and operational by September 30, 2017	Completed	Arrived and operational on October 19, 2017 (2.1.2)
Increase ANFO product load capacity by adding an additional ANFO truck to the fleet	New ANFO truck on site and operational by January 31, 2018	Completed	Commissioned January 5 and became operational by January 8, 2018 (2.1.3)
Install two in pit deep wells	Sump installed by December 31, 2018	Ongoing	Sump installed in October 2017 (2.1.4)
Planning and scheduling loading versus detonating time.	Decrease quarterly average sleep time from 6 days (August Year-to-Date YTD) to 5 in Q4 2017	Average Sleep Time: Q4 2017 - 4.5 days	Sleep time target achieved for Q4 2017 (2.1.5)
Double Prime 100% of production blast holes and implement recommendations generated from misfire incident investigations	Misfires: 10% reduction compared to 2016	YTD Total Misfire Reduction: 43%	LCO exceeded target in 2017 (2.1.6)
Maintain up to date training plan	Up to date plan	Ongoing	Plan available upon request
All drill and blast personnel trained in the following Standard Practices and Procedures (SP&P's): MO4 Blasting; MO24 Dewatering; MO35 Handling Misfires; EV15 Spill and Environmental Emergency reporting; LCO Nitrogen Management Plan (NMP).	100% of drill and blast personnel trained as per the schedule below: MO.04 - every 36 months; MO.15 Drill - every 36 months; MO. 15c Critical Drill Operation - every 18 months; LCO (NMP) - every 18 months, starting January 1, 2018	Completed	All D&B Personnel trained in SP&P's and NMP (2.1.7)
Eliminate augured explosive emulsions in blasting boreholes	0% use of augured emulsion	0% use of RIO500 since June 2016	RIO700 is unable to be loaded by auguring due to product requirements (2.1.8)
Use liners in all boreholes loaded with ANFO	100% use of borehole liners in ANFO holes	100% use of borehole liners with ANFO since Q1 2016	As per SP&P MO.04, all ANFO holes are to be lined (2.1.9)
MSAW Project	Adhere to HSP pumping plan	Currently Implemented	Observed potential positive effects of dewatering of HSP during low flow conditions (2.1.10)

2.1 Additional comments

2.1.1 Summary of average ANFO use

LCO's target average ANFO usage for Q4 2017 was 30%. The results for the quarter exceeded the target with an average ANFO usage of 34%. This reflects the progress LCO made to increase the dry product usage from 23% in Q3. Compared to 2016, LCO increased the annual average ANFO usage from 25% to 27% (Table 2).

With an additional dewatering truck, LCO is able to increase capacity by creating truck availability during maintenance events of the alternate dewatering truck. Improvements to dewatering truck productivity have created more opportunities for LCO to load ANFO.

Despite the acquisition of another dewatering truck, the challenge associated with dynamic water in the pits is still present. Although efforts are made to dewater holes as per dewatering procedures, there are holes that recharge too quickly and emulsion is loaded. During the CAP awareness presentations to the Drill and Blasting crews in Q4, it was emphasized that, although ANFO loading is encouraged and preferred over emulsion, it must be done under the right conditions to avoid the possibility of misfires.

To assist with the reduction of dynamic water and contribute to higher ANFO usage, LCO will be taking action in 2018 to develop a hydrogeological model for the site to assess a site-wide dewatering system (2.1.4). Water management will contribute to increasing the average ANFO use to a YTD average of 35% in 2018.

Table 2: 2017 ANFO Usage

	Month	% of ANFO use	Q Average %
Q1	January	38	32
	February	30	
	March	28	
Q2	April	29	17
	May	10	
	June	11	
Q3	July	5	23
	August	33	
	September	31	
Q4	October	30	34
	November	31	
	December	43	
Annual Average (%)		27	

2.1.2 Additional dewatering truck

On October 19, 2017 an additional dewatering truck with a higher capacity pump arrived on site and became operational. Obtaining the new truck allowed for more dewatering support (2.1.1) to increase the opportunities to load more ANFO.

2.1.3 Additional ANFO truck

The new ANFO truck was ordered in September 2017 from a manufacturing company in the USA with a potential delivery date on December 15th. The ANFO truck shipped from the USA on December 31, 2017 and became fully commissioned and operational by January 8, 2018.

Although the ANFO truck was delayed, it did not restrict LCO's ability to achieve the target ANFO usage for Q4 2017. Compared to 2016, LCO has been able to load 741,743 kg (13%) more ANFO in 2017 with the additional truck. Typically, the previous ANFO truck took approximately 2 minutes to load a hole. With the new truck, ANFO can be loaded in approximately 1.5 minutes. The improved efficiency and capacity of having both trucks available will increase LCO's opportunities to load more ANFO going forward.

2.1.4 In pit deep well/sump in BRX

As detailed in the Q3 CAP report LCO completed the installation of an in pit deep well in the BRX pit (October 23, 2017). The in pit deep well consisted of a 30 m cased well (two benches deep and drilled in blasted material) located in the northwest side of BRX. On November 10, 2017, the deep well became inaccessible due to mine sequencing changes. LCO assessed other opportunities to install an additional in pit deep well in blasted material, but the mine sequence did not allow room for it before the end of 2017.

LCO committed to the installation of two in-pit deep wells/blasted sumps in 2018 at a location and timeline that will be determined according to the mining sequence.

In January 2018, LCO installed a blasted sump in the North East side of BRX and on January 15, a surface pump was installed. However, the pump only ran for a couple of hours before the sump went dry (approximate pumped volume of 400 m³). LCO will report final volumes in Q1-2018 quarterly report.

2.1.5 Summary of average sleep time

One of the CAP targets was to reduce the sleep time for 700 product (Emulsion) from a YTD average of 6 days to a quarterly average of 5 days or less in Q4 2017 and maintain this average in 2018. LCO achieved the target with a quarterly average of 4.5 days for Q4. This success was due to several factors including, but not limited to, an increase in the awareness of LCO's CAP objectives, incorporating sleep time objectives into mine planning, and actively identifying wet holes early in order to delay the loading process of emulsion, reducing sleep time for a pattern. In 2017, LCO had an overall sleep time average of 5.5 days (Table 3).

Table 3: Average Sleep Time

	Month	Average Sleep Time (days)	Q Average (days)
Q1	January	4.5	5.9
	February	6.1	
	March	7.1	
Q2	April	5.4	6.6
	May	8.5	
	June	6.2	
Q3	July	6.0	5.3
	August	5.1	
	September	5.0	
Q4	October	5.4	4.5
	November	4.5	
	December	3.5	
Annual Average (days)		5.5	

2.1.6 Summary of percent misfires

From January to the end of December 2017, LCO had 67 misfires. In 2016, the total number of misfires was 117. LCO reduced the total number of misfires by 43% by the end of 2017 (Table 4).

Although 73% of explosive product loaded in 2017 was RIO700, the majority of misfires observed were related to ANFO. Despite the increase in ANFO usage in 2017 (2.1.3), LCO was able to reduce the total number of ANFO misfires by 48% and the number of RIO700 misfires by 21%. These results indicate that the actions taken by LCO over the last year to reduce misfires have been successful for both emulsion and ANFO product (Table 4).

By continuing to double prime all production blast holes as per procedure (MO.04 Blasting – 4.2 Priming), loading the right product according to SP&P MO.24, dewatering, and implementing recommendations generated from misfire incident investigations, LCO anticipates that the number of misfires in 2018 will be at or below the 2017 total.

Table 4: Number of Misfires

Misfires	ANFO	Emulsion	Total
2016	92	24	117
2017	48	19	67
Reduction (%)	48%	21%	43%

2.1.7 Training

LCO has completed updates to SP&P MO.04, MO.15, MO.24, and MO.35 to incorporate a section on nitrate management and has completed the Nitrogen Management Plan training program. The Nitrogen Management Plan overview, including the CAP was presented to the Blasters, Supervisors and Blast Technicians (B and C Crew) on December 15 and December 18. All blasting personnel were trained on the SP&P package indicated by the CAP (Table 1).

Additionally, Nitrate Management awareness presentations were conducted in Q4 at all quarterly crew meetings (including hourly and staff).

2.1.8 Augured Emulsion

Two methods are used to load explosive product into a blast hole: auguring and pumping. Pumping is done by the explosive truck lowering its product hose to the bottom of the hole and pulling it up as the product is pumped into the blast hole. Auguring is used for products containing 0% emulsion (ANFO) to 65% emulsion blends. Auguring is when the product is essentially discharged from the top of the blast hole and product drops to the bottom of the blast hole.

LCO eliminated the use of RIO500 (50% emulsion and 50% ANFO) in June 2016 and since then only utilizes two products on site: RIO700, which is 30% ANFO and 70% emulsion; and ANFO. Because the emulsion blend for RIO700 exceeds the 65% limit, it is too viscous to auger and can only be pumped into the blast hole.

2.1.9 Borehole Liners

The use of borehole liners when loading ANFO has been implemented since Q1 2016. The lining of all ANFO holes is required as per SP&P MO.04 Blasting. Liners prevent the interaction of moisture with ANFO and prevent the leaching of nitrates. Lining ANFO boreholes is required, even in dry hole conditions.

2.1.10 MSAW/Horseshoe (HSP) Pit temporary storage and release summary

Overview

The MSAW Storage/Release Project is aimed to reduce mine contact water that has accumulated in the MSAW Pit from passively decanting (nitrate load reduction) to Line Creek in the low flow period. The strategy consists of evaluating pumping water from the MSAW Pit to Horseshoe Pit (HSP) for temporary storage and retention during low flow period (Figure A). MSAW Pit is a partially backfilled pit that receives mostly mine influence water from NLX and BRX pits dewatering activities. HSP is an empty pit (not backfilled) that receives mostly non-influenced water from the upper Line Creek watershed and local runoff. During periods of high flows (e.g. freshet), if the flow rates exceed the ability of the Line Creek rock drain to convey the water, water levels will rise behind the rock drain inlet and overflow into HSP. As a critical piece of LCO's flood prevention plan to protect critical site infrastructure, the water then must be discharged into the receiving environment before the next high flow cycle.

Once HSP non-impacted water is discharged, capacity will be evaluated for MSAW water to be pumped and stored into HSP during low flow season for later discharge into Line Creek during high flow.

LCO is currently evaluating the feasibility, efficacy and impact to flood protection of a MSAW dewatering plan, similar to the one presented for HSP (section below), for the dewatering of stored MSAW water from HSP into the receiving environment. Dewatering of stored MSAW water (in HSP) into the receiving environment is projected to occur during high flow conditions in 2018, subject to the dewatering plan's approval in accordance with Condition 1.8 of PE-5353.

HSP Dewatering Summary

Section 1.8 of LCO's Permit 5353 (April 27, 2017) authorizes the discharge of stored pit water from the Horseshoe Pit (HSP), (E308146) and MSAW Pit (MSAW), (E308147) to Line Creek. On July 2017, LCO submitted the HSP Dewatering Plan to ENV to fulfill the requirements of Section 1.8.4 of Permit 5353.

As per the HSP Dewatering Plan, LCO discharged (From August 2017 to March 2018) non-mining impacted water from the upper Line Creek watershed and local groundwater into Line Creek. Water is drawn from HSP (Figure A), conveyed by a pipeline and discharged to the Line Creek rock drain, downstream of discharge from the No Name Creek Pond (LC_LC9 – E221268). Discharge of water from HSP is required to maintain water levels in the pit at an acceptable level to avoid flood risk to buildings and critical infrastructure. The objective of the Dewatering Plan is to lower the pit water level to near empty prior to freshet in 2018

A summary of the proposed vs current conditions is presented in Table 5.

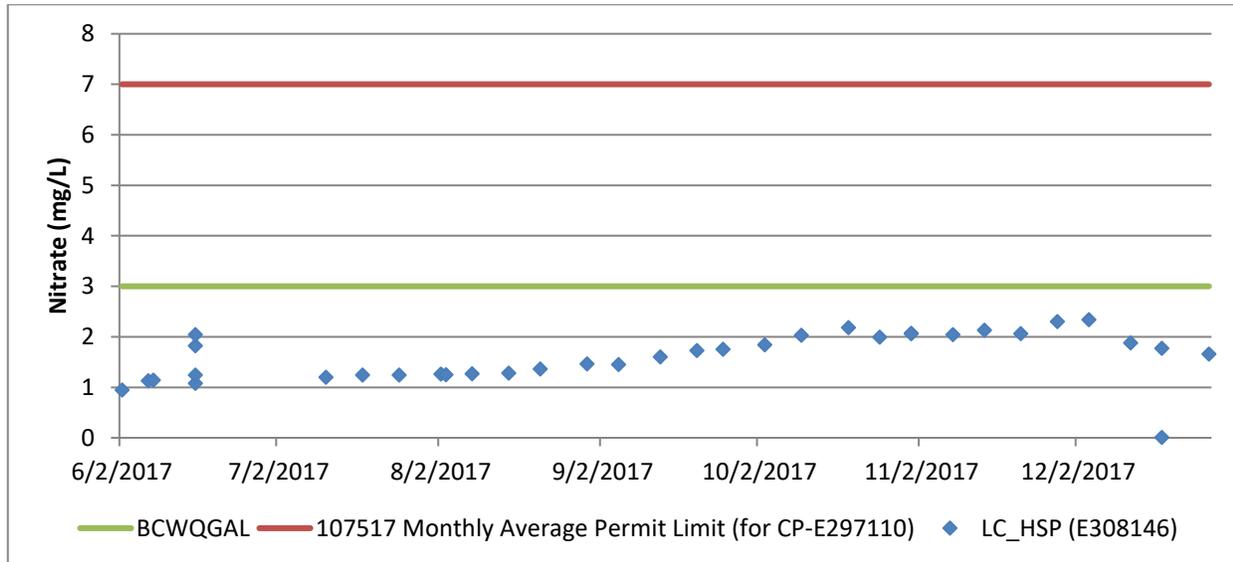

Table 5: Proposed vs current dewatering conditions

	Proposed	Current Conditions
Time frame	August – December	August 3 – March 2, 2018
Volume	1.8 Mm ³	1,462,705 m ³ pumped
Water elevation (target)	1540 m	1542m ¹
Pumping rates	Up to 25,000 m ³ /d	Approx. 8,000 m ³ /day

As per HSP Dewatering Plan (Section 4.3) all water quality sampling results of the discharge and receiving environment will be submitted with the quarterly report and uploaded to the EMS database as per Section 4.2 of PE 5353.

In 2017, nitrate results (Figure 3) for LC_HSP (E308146) ranged from 0.95 to 2.34 mg/L. These concentrations were below the British Columbia Water Quality Guidelines for Aquatic Life (BCWQGAL; 3 mg/L).

Figure 3: 2017 Nitrate Concentrations at LC_HSP – E308146

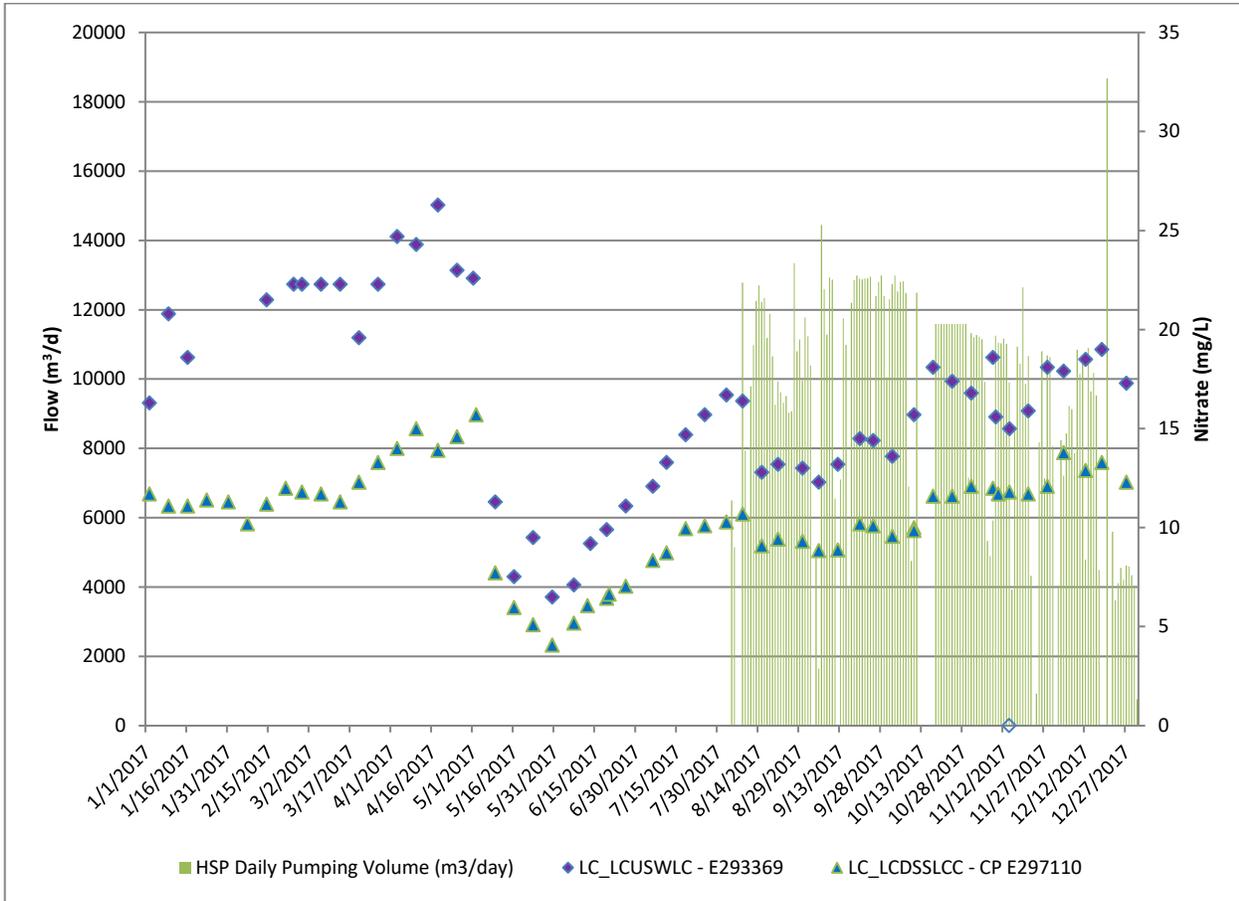

Water sampling location LC_LCUSWLC provides information on mine influence on water quality before the influence of the discharge of the AWTF. Nitrate concentrations at CP-E297110 follow a similar trend to LC_LCUSWLC.

2017 sampling results for receiving environment monitoring station LC_LCUSWLC – E293369, located immediately below the Line Creek rock drain and upstream of the West Line Creek, indicated that at the start of pumping from HSP (in August 2017) nitrate concentrations decreased (Figure 4 and Figure 7). In Q4, there were periods of time (3.1.1) when the pumps were off for maintenance and since October 17, 2017, the WLC AWTF is operating to almost half its throughput volume (2,500 m³/day).

¹ 1548.3 water elevation as of January 17, 2018.

Figure 4: 2017 Nitrate Concentrations at LC_LCUSWLC and CP-E297110

LCO followed the HSP dewatering Plan and notified on March 2, 2018 the pit pumping completion to ENV (as per section 1.8.9 of PE-5353).

3 LCO Nitrate Monitoring Program

As per Table A1 – Appendix A of the CAP, LCO has an extensive monitoring program that includes permitted and non-permitted locations.

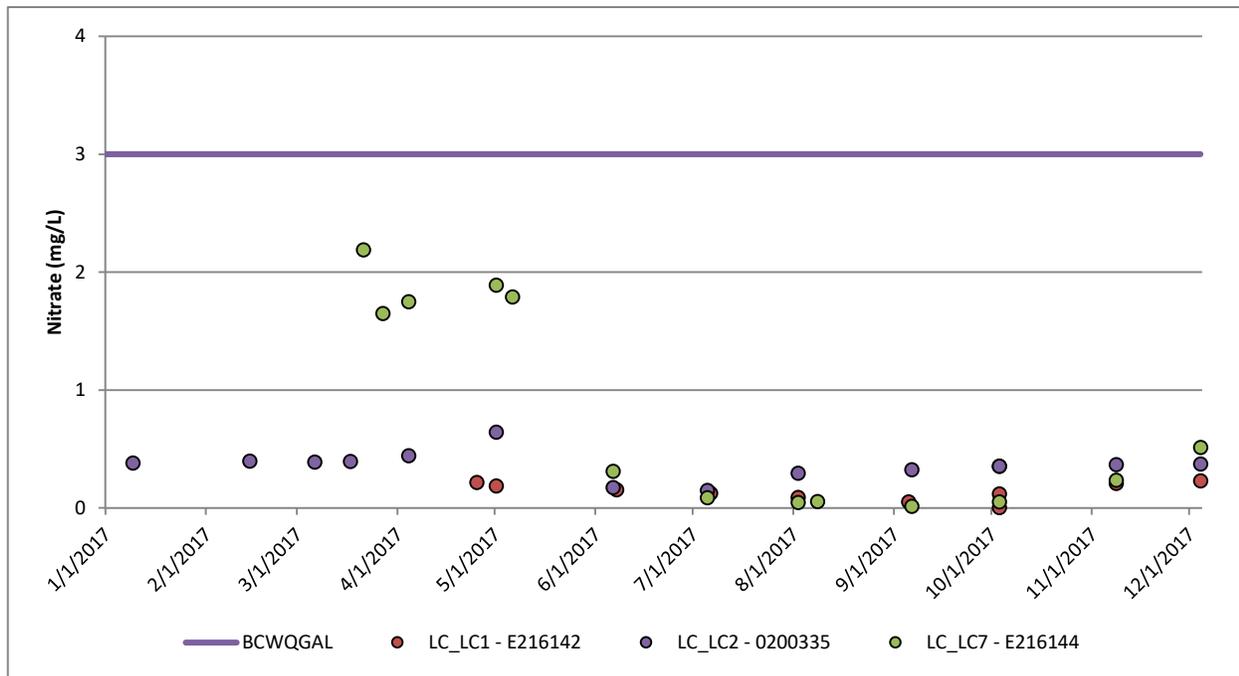

These monitoring locations were chosen to assess nitrate concentrations trends (since June 2014² to date) while implementing the CAP (Figure B, Appendix A).

3.1.1 Line Creek Phase 1

LC_LC1 (E216142) and LC_LC2 (0200335) are located in the Upper Line Creek drainage and represent receiving environment monitoring locations with limited (LC_LC2) or without mine influence (LC_LC1). LC_LC7 – E216144 is the discharge monitoring location for the MSA North Ponds, which receives water influenced by the MSX short spoil³ and historical mining disturbance in MSA North area.

In 2017, nitrate concentrations at LC_LC2 and LC_LC7 were the highest since June 2014 (Figures 5 and 6). Nitrate concentrations were the highest during the months of March, April and May in 2017. Although nitrate concentrations at these locations peaked during these months, they have remained below BCWQGAL.

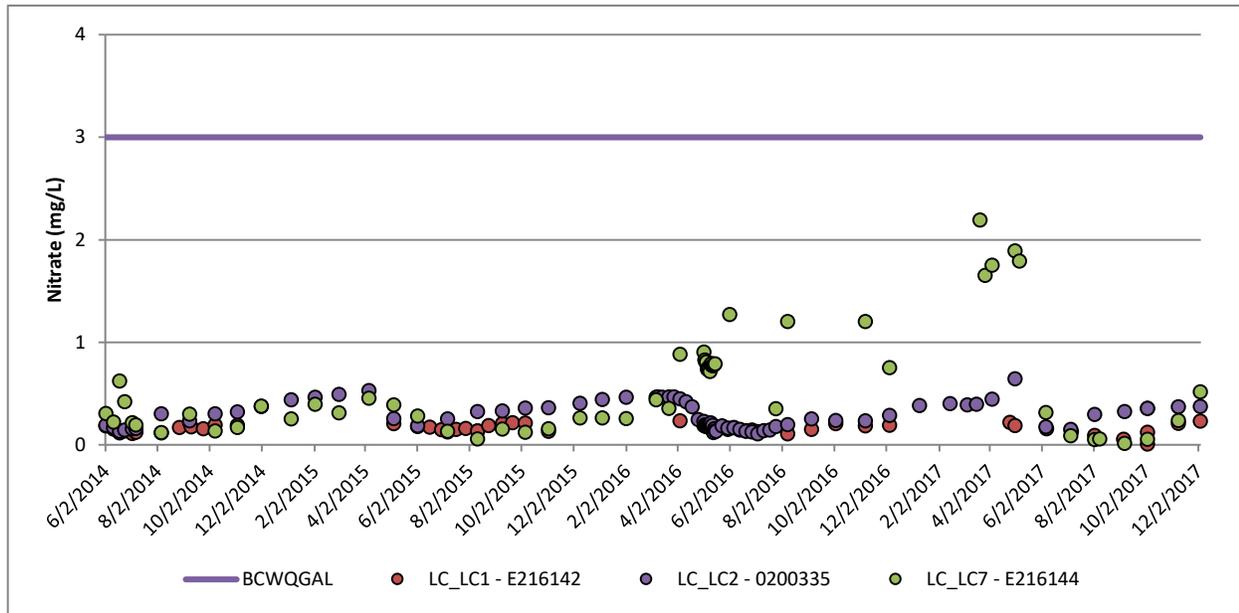

Figure 5: 2017 Nitrate Concentrations at LC_LC1 (E216142), LC_LC2 (0200335) and LC_LC7 (E216144)

² This day represents the oldest data at CP-E297110

³ Waste rock placement in MSX short spoils concluded around end of November 2017.

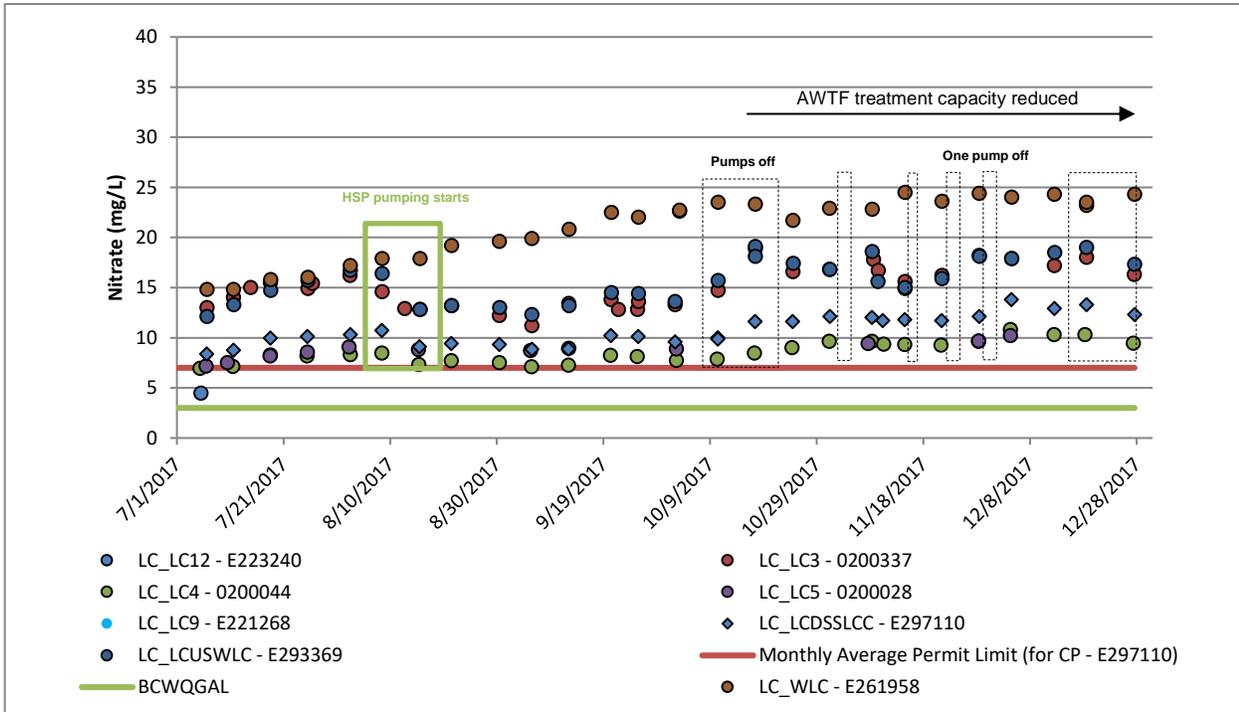

Figure 6: Nitrate Concentrations at LC_LC1 (E216142), LC_LC2 (0200335) and LC_LC7 (E216144) – June 2014 to date.

All monitoring locations presented in Figure 7 are located downstream of the rock drain and are influenced by current mining activities. The exception is LC_WLC – E261958, which represents mine influence water from the west spoils area; water at this site is treated in the WLC AWTF.

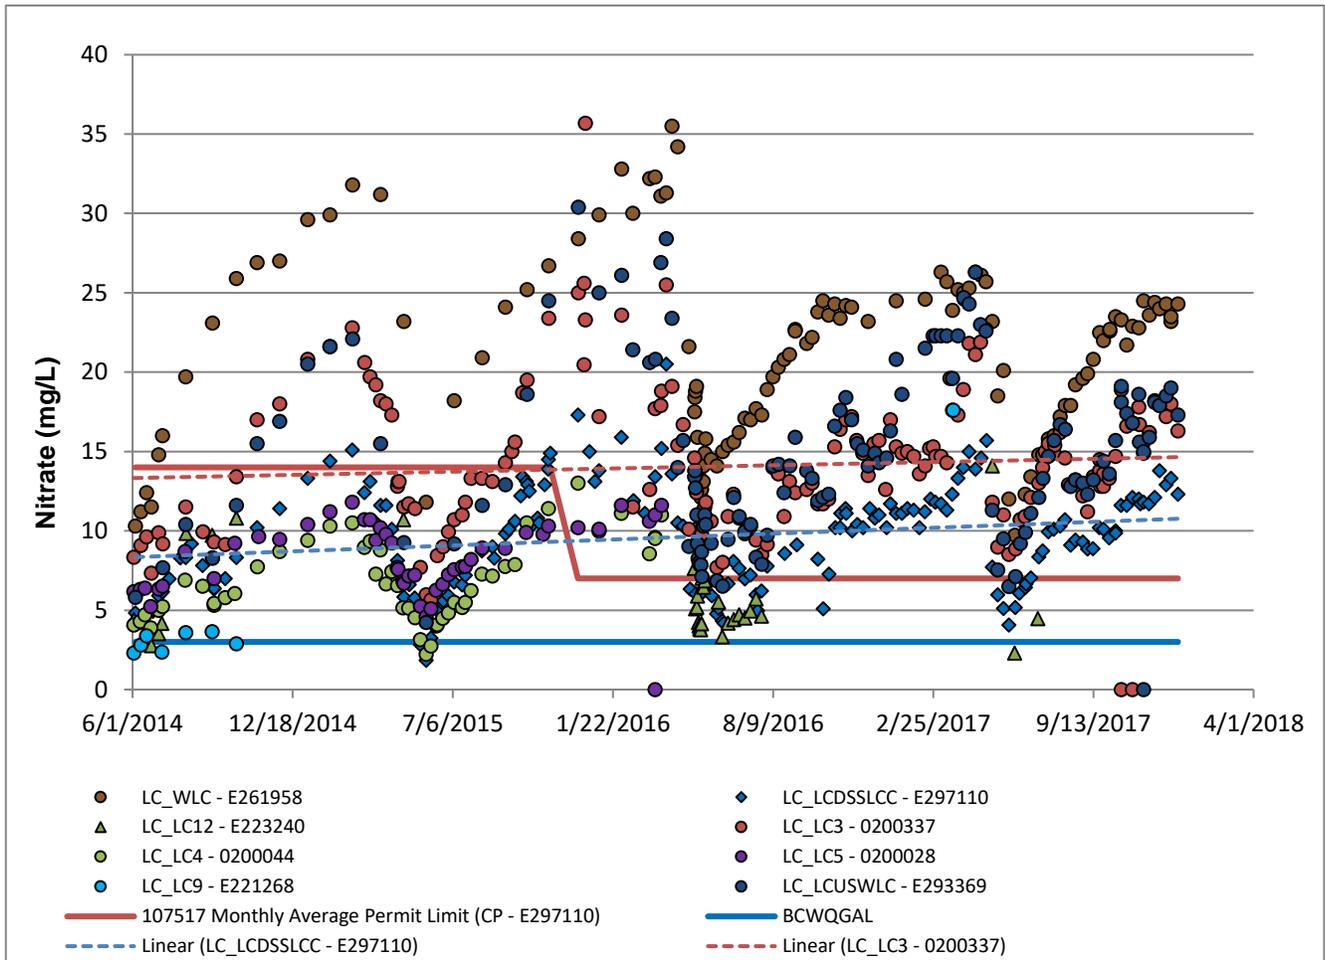

Q3 and Q4 results downstream of the rock drain showed a potentially positive influence of the HSP (non-contact water) dewatering activities on nitrate concentrations. In July, (prior to pumping) all sampling results presented a similar (increasing) trend. Immediately after pumping commenced, nitrate concentrations at all stations except for LC_WLC showed decreased nitrate concentrations. LC_WLC does not influenced by HSP dewatering activities. The dashed squares in Figure 7 represent either the periods of time where both pumps were off or one of them was not working properly. These periods of reduced or no pumping and the fact that the WLC AWTF is currently operating at reduced volume since October 17, 2017, correlate with increases in nitrate concentrations. Pump shutdowns were mostly due to system maintenance due to freezing conditions (pump repairs, freezing lines, etc.).

Figure 7: Q3 & Q4 Nitrate Concentrations at Monitoring Locations Downstream of Line Creek and West Line Creek Rock Drains

Monitoring results from June 2014 for monitoring locations downstream of Line Creek and West Line Creek to December 2017 are shown in Figure 8.

Figure 8: Nitrate Concentrations at Monitoring Locations Downstream of Line Creek and West Line Creek Rock Drains (June 2014 to December 2017)

3.1.2 Line Creek Phase 2

Line Creek Phase II predominately exists within the catchment area of Dry Creek, a tributary of the Fording River. The East Tributary of Dry Creek (DC_DCEF, E288274), Unnamed Creek (LC_UC, E295213), Grace Creek (LC_GRCK, E288275) and Chauncey Creek (RG_CH1, E295214) represent receiving environment monitoring locations not currently influenced by mining activities.

LC_DC3 (E288273) represents the inflow of mine-influenced water into the Dry Creek Water Management System (DCWMS). LC_SPDC (E295211) is the monitoring location for the discharge from the DCWMS to the receiving environment. Dry Creek downstream of sedimentation ponds (LC_DCDS, E295210), Dry Creek near mouth (LC_DC1, E288270), and Fording River downstream of Dry Creek (LC_FRDSDC, E288272) are downstream of discharge from the DCWMS. LC_FRDSDC also receives influence from Fording River Operations and will not be discussed in detail in this report.

The 2017 results show increasing nitrate trends at LC_DCDS, LC_DC1, and LC_SPDC. Additionally, the concentrations observed at LC_DCDS and LC_SPDC have increased in 2017 above the BCWQG for nitrate (Figure 10). This rise in nitrate concentrations at monitoring locations upstream of DC1 is likely in response to increased waste rock placement in Dry Creek (BRX spoil) as volumes increased from 12.5M BCMs placed in 2016 (cumulative volume of 13.5M BCMs) to a volume of 18.2M BCM's placed in 2017.

Figure 9: 2017 Nitrate Concentrations at Dry Creek monitoring locations.

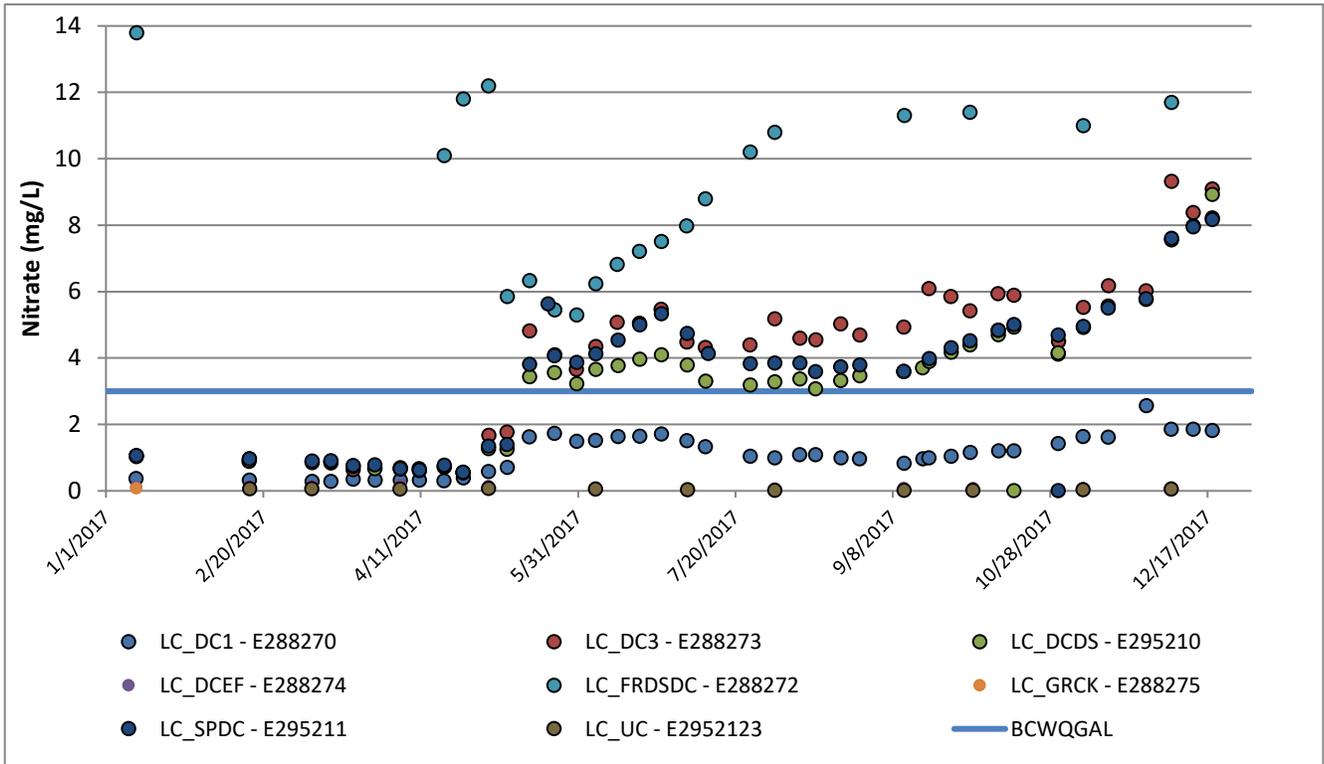

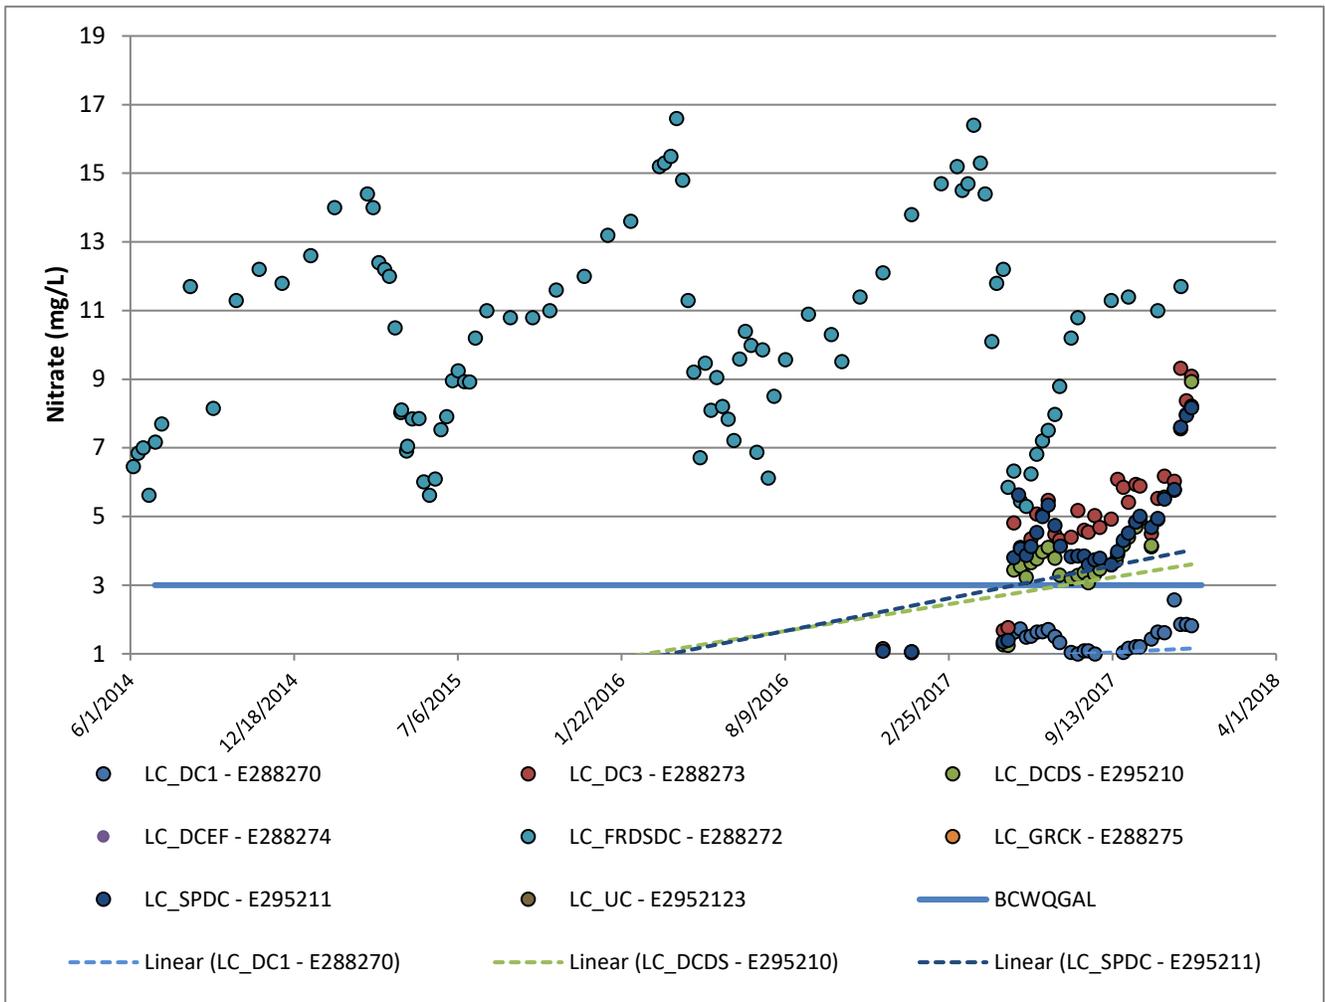

Figure 10: Nitrate concentrations at Dry creek monitoring locations (June 2014 to December 2017)

3.1.3 Operational Projects and Studies

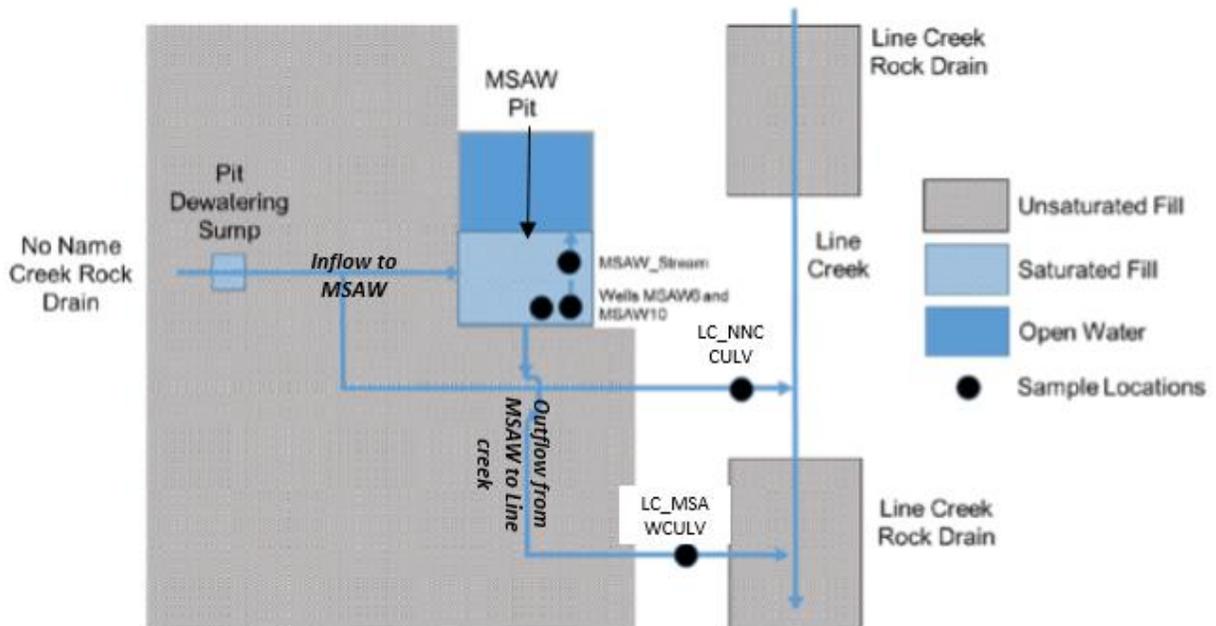

In Pit Dewatering and MSAW Project (Storage – Release Strategy)

As described in 2.1.10, the MSAW Storage/Release Project is aimed to reduce the volume of mine-contacted water that has accumulated in the MSAW Pit from passively decanting (nitrate load reduction) to Line Creek in the low flow period. The strategy consists of pumping water from the MSAW Pit to HSP for temporary storage and retention during low flow period.

As part of the MSAW project, LCO is assessing the use of a saturated rock fill (SRF) environment for the removal of nitrate and selenium (as described in CAP, September 14, 2017). As part of the assessment, LCO has been collecting water chemistry data at MSAW Pit inflow (LC_NNCCULV), outflow (LC_MSAWCULV) and groundwater wells located in the MSAW pit at different depths (LC_MSAW6_100, LC_MSAW6_150, LC_MSAW6_190, LC_MSAW6, LC_MSAW10_150) since April 22, 2016. Additional in pit dewatering monitoring locations (LC_BRSDW, LC_NLXEast) were included as part of the assessment.

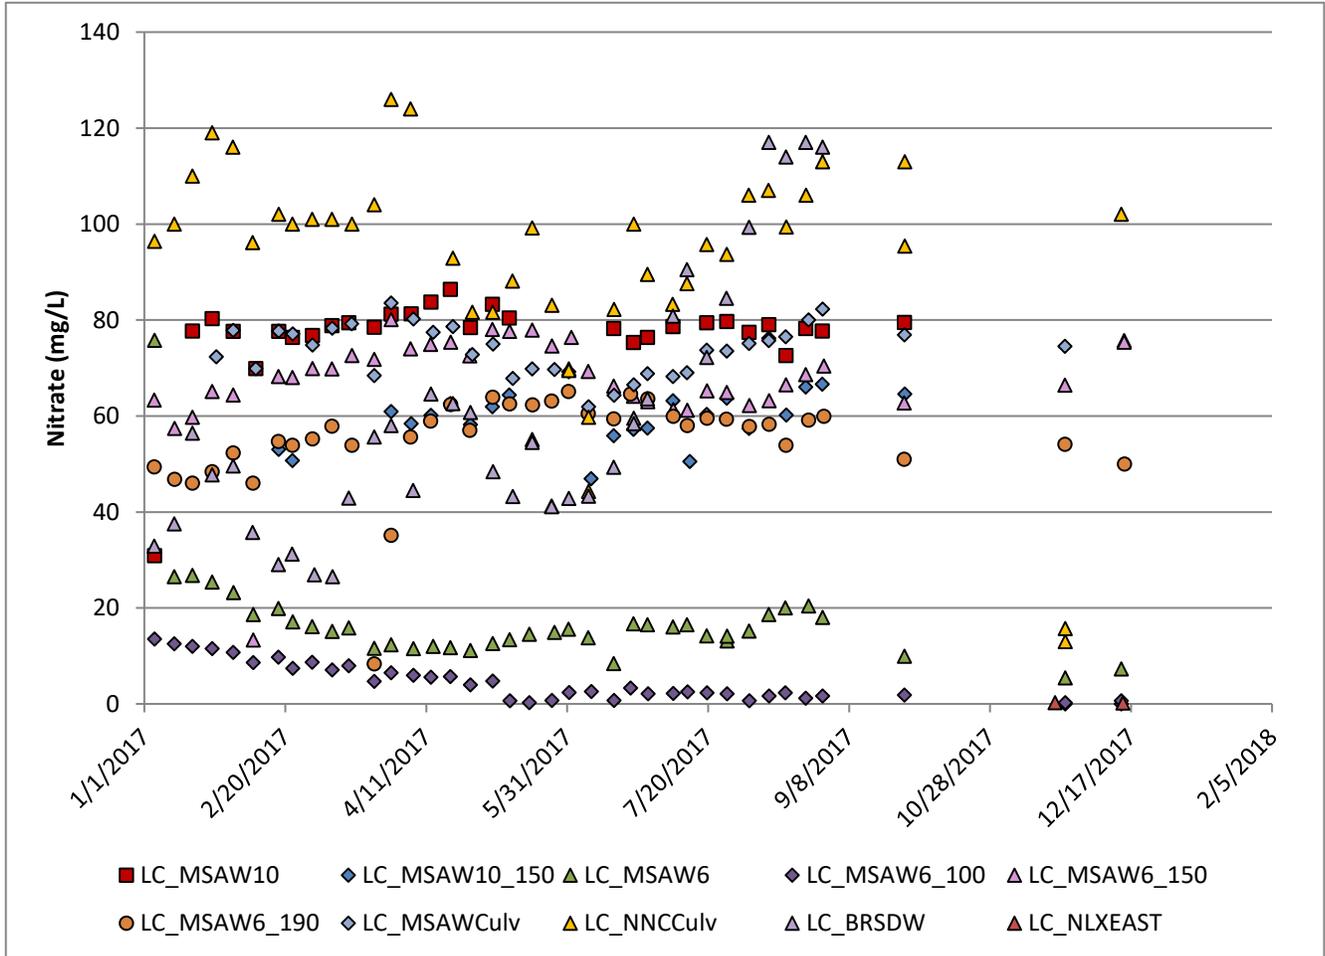

The schematics of the flow system in MSAW Pit are presented in Figure 11.

Figure 11: Schematic of Flow System and Monitoring Locations

Nitrate monitoring results (2017) are presented in Figure 12. Results from the inflow (LC_NNCCULV) vs the outflow (LC_MSAWCULV) indicate a potential reduction of nitrate concentrations within the pit. Monitoring results from the six groundwater monitoring wells also indicate that reduction occur at different depths⁴.

Figure 12: MSAW Pit monitoring locations

For the potential MSAW water release (MSAW Pit water stored in HSP to release into Line creek) phase (May-June 2018), LCO is currently developing a pit pumping plan and projected concentrations to ensure that nitrate (and other Constituents of Concern) compliance objectives can be met.

⁴ MSAW10 and MSAW10_150 are 10" wells at 250' and 150' respectively, below surface. MSAW6, MSAW6_100, MSAW6_150 and MSAW6_190 are 6" monitoring wells at 60', 100', 130' and 190' respectively, below surface.

4 Nitrate Management Actions

Other actions that occurred during 2017 were:

1. Nitrate education session, provided by Teck representatives and the LCO nitrate working group to key internal LCO stakeholders including representatives from each department - November 22, 2017.

The presentation included:

- The importance with managing nitrates with respect to regional and local influence, potential aquatic effects
- Compliance Action Plan – Objectives and targets, results to date

2. Awareness presentation of the Nitrogen Management Plan provided to all Blasting personnel (LCO and Maxam) – December 2017.

The awareness presentation included the following:

- Description of the importance of managing nitrates on site (effect of surface and groundwater quality with potential consequences to aquatic life, permit and regulatory requirements, social license to operate, sustainability objectives, production costs, etc.)
- Objectives for reducing the nitrate concentrations on site
- The relationship between the NMP, CAP, and SP&P's

3. CAP detailed presentation to internal stakeholders (Short and Long Range, Drill and Blast, Projects Engineers) to discuss objectives and timelines – September 2017

The CAP detailed presentation included the following:

- Review of the nitrates management importance and background/permit information;
- Review of the latest version of the CAP (September 14, 2017)
- Review of the internal timeline and actions to achieve KPI's. Discussion on how these actions are integrated into regular mine planning activities

4. Engagement with the Water Projects group to evaluate the potential for LCO SRF trial with the decision to proceed dependent upon the results of the Elkview Operations SRF trial.

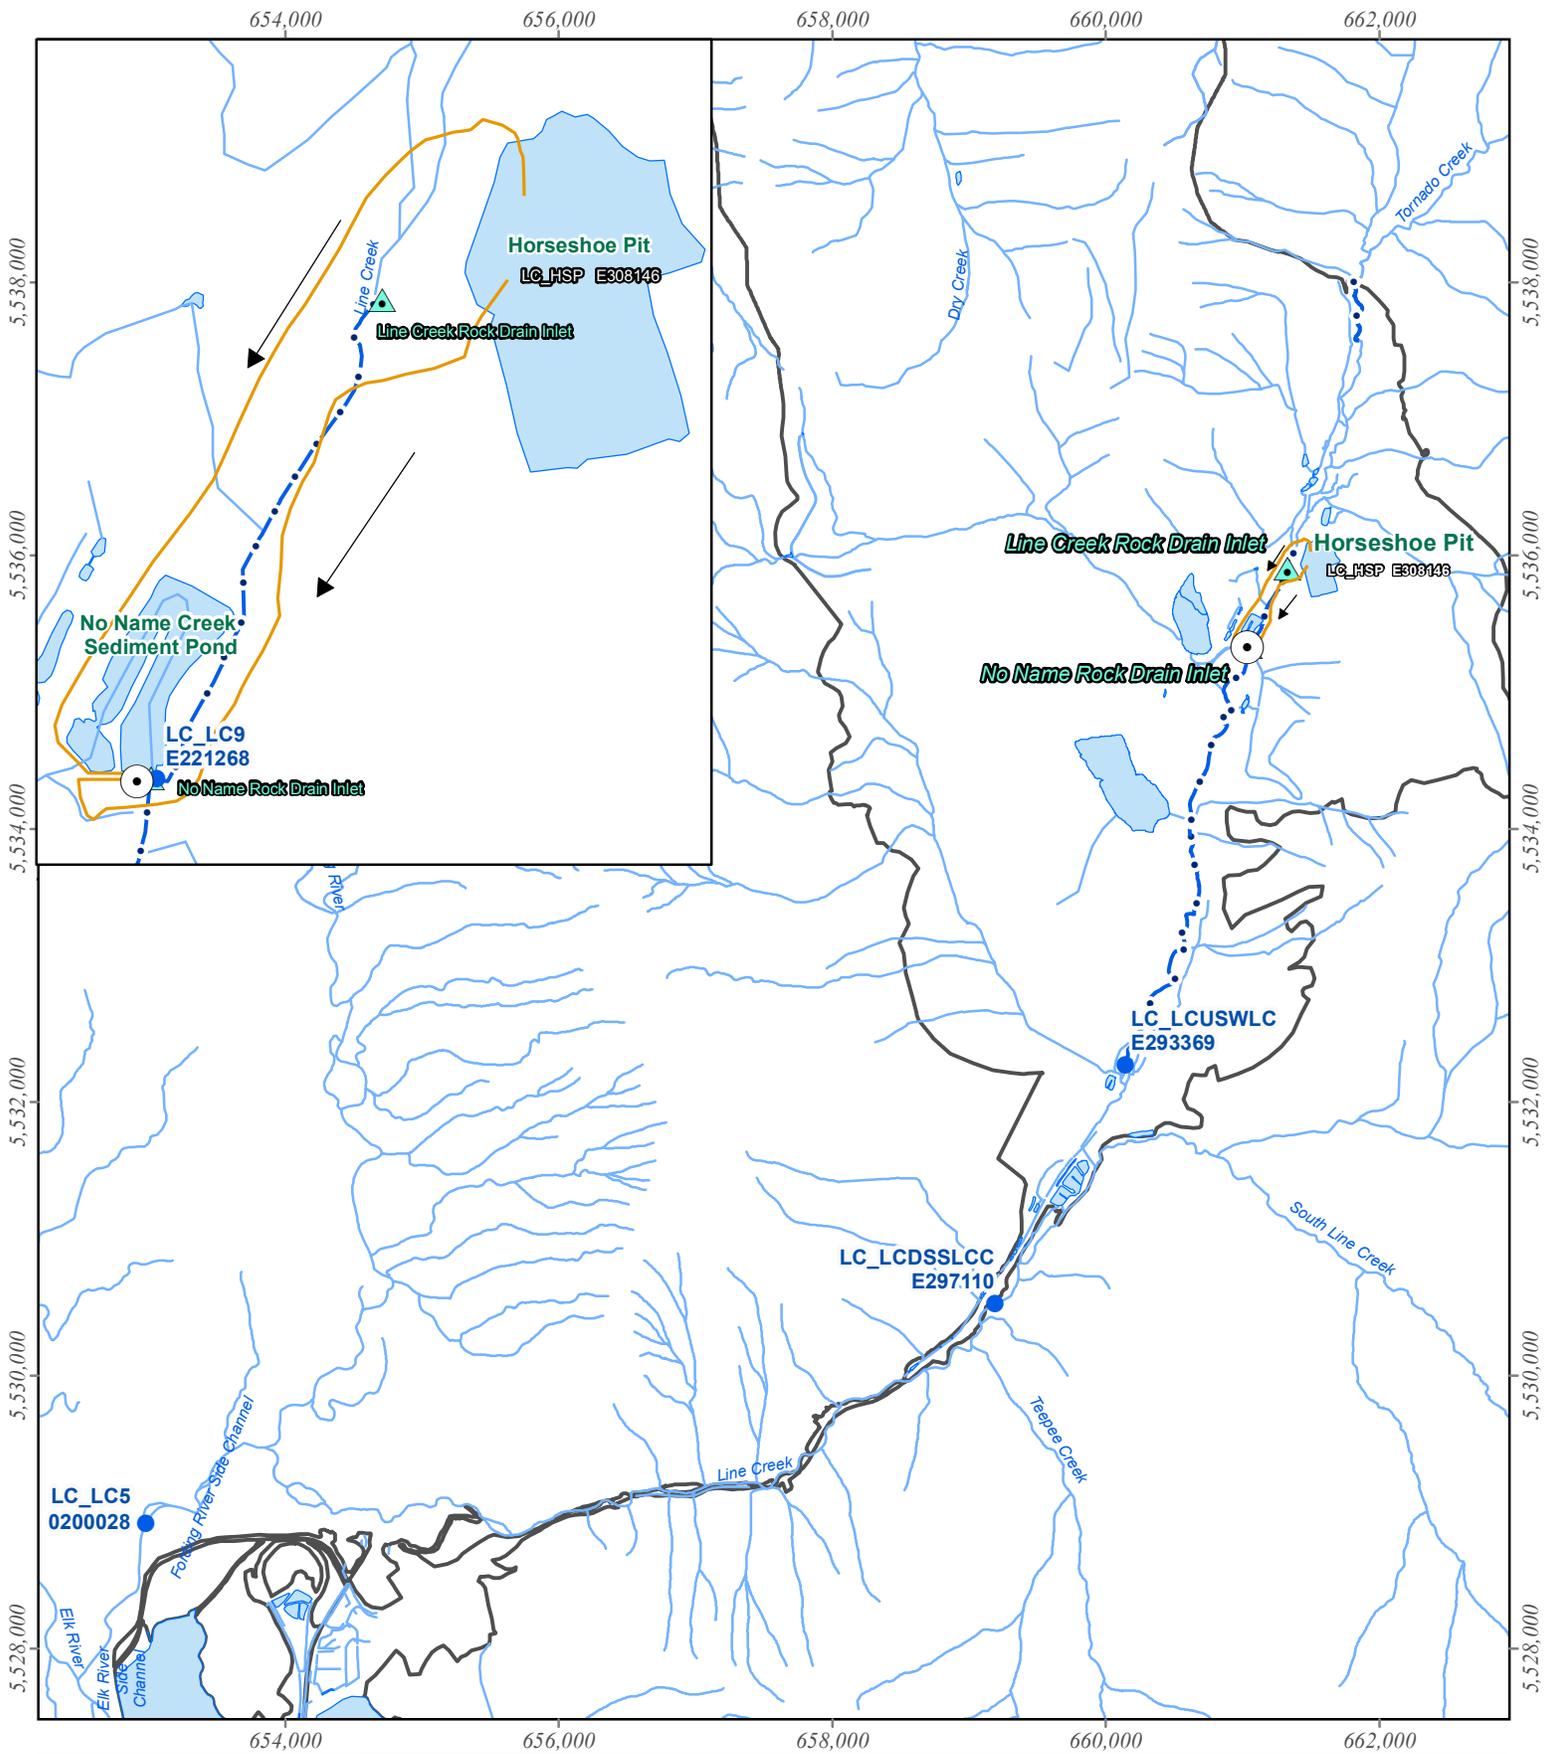

5. Q4 safety meetings: during quarterly safety meetings to all crews and staff, a CAP awareness presentation was provided. The emphasis was on explaining the importance of nitrate management and a summary of KPI's to date.

6. Nitrogen Management Plan updates: a working group within the business unit has been created to align nitrogen management practices across all Teck Coal locations.
