Report: Permit 107517 Annual Water Quality Monitoring Report, 2017 (March 31, 2018)

Overview: This report presents the 2017 results of the surface water monitoring program required under Permit 107517. The report summarizes environmental incidents (i.e., non-compliances) recorded in 2017, summarizes monitoring data for discharges and receiving environment water sampling sites set forth in Permit 107517, and provides an assessment of the data.

This report was prepared by Teck and includes a flow monitoring component prepared by Kerr Wood Leidal.

Annual Water Quality Monitoring Report

March 31, 2018

Carla Fraser, RPF
Manager Regional Water Monitoring

Mariah Arnold, PhD, R.P. Bio.
Senior Lead Regional Water Monitoring

Michael Moore EP, Water Quality
Lead Regional Water Monitoring

Table of Contents

List of Tables.....	iv
List of Figures	iv
Abbreviations	1
Executive Summary	2
1 Introduction	4
1.1 Authorized Discharge and Receiving Environment Water Sampling Sites	4
1.1.1 Compliance Points.....	10
1.1.2 Order Stations.....	11
2 Compliance	12
2.1 Effluent Limits and Site Performance Objectives at Compliance Points.....	12
2.2 Site Performance Objectives at Order Stations	35
2.3 Non-Compliances.....	45
2.3.1 Compliance Point/Order Station Limit/SPO Exceedances (Category 1)	45
2.3.2 Acute Toxicity Failures (Category 2)	49
2.3.3 Missed Samples (Category 3)	49
2.3.4 Administrative Non-Compliances (Category 4).....	51
2.3.5 Hold Time Exceedances (Category 5)	51
2.4 Unattainable Sample Data	52
3 Surface Water Monitoring Program	53
3.1 Surface Water Monitoring Program.....	53
3.2 Quality Assurance/Quality Control Program	54
3.2.1 Teck Data Quality Objectives.....	54
3.2.2 Quantifying DQOs.....	55
3.3 QA/QC Issues.....	57
3.4 Toxicity Testing Program.....	60
4 Spills and Incidents.....	61
5 Monitoring Results	62
5.1 Surface Water Quality – Receiving Environment.....	62

5.1.1	Mercury Results Above BC WQGs	65
5.1.2	Uranium Results Above BC WQGs.....	66
5.1.3	Iron Results Above BC WQGs.....	68
5.1.4	Cobalt Results Above BC WQGs.....	70
5.1.5	Nitrite Results Above BC WQGs	72
5.1.6	Beryllium Results Above BC WQGs.....	73
5.1.7	Field Parameters Results Above BC WQGs	73
5.2	Three Year Trend Analysis of SPOs at Order Stations.....	74
5.2.1	Selenium Trends.....	76
5.2.2	Nitrate Nitrogen (as NO ₃) Trends.....	80
5.2.3	Sulphate (SO ₄) Trends	83
5.2.4	Cadmium Trends.....	87
5.3	Source Discharges of Order-Defined Constituents of Interest.....	91
5.3.1	Selenium.....	91
5.3.2	Nitrate-N	95

SP&P	Standard Practices and Procedures
SPO	Site performance objective
TIE	Toxicity Identification Evaluation
TKN	Total Kjeldahl Nitrogen
WLC AWTF	West Line Creek Active Water Treatment Facility

Executive Summary

Permit 107517 takes an area based approach to authorizing and managing water quality constituents of interest originating from current and historical mining activities in the Elk Valley. To do so requires an extensive surface water monitoring program that includes authorized discharges, receiving environment and other sampling sites, eight authorized discharge Compliance Points, and seven Order Stations for which Site Performance Objectives (SPO) have been established. These permitted sampling locations are used to evaluate compliance, and supporting implementation of the Elk Valley Water Quality Plan. The following report is submitted in fulfillment of Section 10.2.4 of Permit 107517 and summarizes: non-compliances experienced in 2017, water quality/quantity measurements relative to appropriate compliance limits, Site Performance Objectives, and/or approved and working water quality guidelines, toxicity tests, and Quality Assurance/Quality Control issues during the 2017 calendar year.

In 2017 Site Performance Objectives for selenium, nitrate, sulphate and cadmium were met at all Order Stations in 100% of water samples collected and 90.2% of all samples collected at Compliance Points were below permit limits. In addition, only 1.6% of all parameters analyzed and compared to approved British Columbia Water Quality Guidelines were above said guideline (excluding parameters with Site Performance Objectives and compliance limits). The non-compliances in 2017 were associated with Compliance Points E300071 (FR_FRCP1), E297110 (LC_LCDSSLCC), and E258937 (CM_MC2).

Permit limit exceedances recorded at Fording River Operations' Compliance Point FR_FRCP1 were for selenium and sulphate. Water quality and quantity monitoring data have indicated that surface water at FR_FRCP1 is predominantly discharge water from the mine-impacted Cataract Creek during low flow months. Teck is currently compiling the information requested by the Ministry of Environment and Climate Change Strategy to support the submission of an application to amend Permit 107517 and move the Fording River Compliance Point to a location that is more suitable for assessing compliance. Submission of the amendment application is targeted for early 2018.

Non-compliances associated with Line Creek Compliance Point LC_LCDSSLCC were for selenium and nitrate. As stated in the 2016 annual water quality report, the LCO Compliance Point limits for nitrate were reduced from 14 mg/L monthly average and 20 mg/L daily maximum to 7 mg/L monthly average and 9 mg/L daily maximum. These changes in limits were initially defined based on modelling that included limited data at this location. Since this time, additional monitoring data indicates that the regional water quality model did not adequately represent the nitrate loadings in Line Creek. In order to improve water quality, Teck has since developed and received approval (January 9, 2018) from the Ministry of Environment and Climate Change Strategy (ENV) for a Nitrate Compliance Action Plan (CAP), which outlines the path forward to support permit compliance for nitrate concentrations in Line Creek. Developed with input from ENV and the Ktunaxa Nation Council (KNC), the approved CAP identifies objectives, key performance indicators (KPIs), and actions that Teck has taken and will take to reduce nitrate concentrations to support compliance with Permit 107517 limits at this compliance point. The CAP will be updated as required to incorporate learnings from monitoring results and the Regional Water Quality Model update. Despite higher than projected nitrate concentrations in Line Creek as measured at the LCO Compliance Point, nitrate concentrations at the Line Creek Order

Station in the Fording River (FR5, LC_LC5) have remained below the SPO during all periods to date. With respect to the selenium non-compliances, Teck has been working to address a challenge in the performance of our West Line Creek Active Water Treatment Facility (WLC AWTF) related to compounds of selenium in discharge water. Teck reduced the flow rate of the WLC AWTF from 5,500 m³/day to 2,500 m³/day on October 17, 2017, limiting the amount of selenium that is removed from Line Creek. This change in treatment volume increased selenium concentrations downstream in Line Creek, resulting in exceedances at the LCO Compliance Point. Teck submitted an application package to ENV to temporarily take the facility offline; approval was granted on February 28 and the shutdown process has been initiated. Teck recently completed the successful piloting of an advanced oxidation process (AOP) system which has been identified as a solution to managing compounds of selenium. The AOP system will be constructed and the WLC AWTF will be recommissioned in August 2018 to work towards full capacity over a commissioning period.

The one non-compliance in January 2017 at the Coal Mountain Compliance Point, CM_MC2, was due to elevated concentrations in water that was pumped to support pit dewatering activities but due to low winter flow conditions, caused an exceedance to nitrate permit limits. Pumping rates were immediately adjusted to bring nitrate concentrations back within permit limit. Since this incident, all samples collected since have met permit requirements.

Non-compliances were also recorded in 2017 associated with *Daphnia magna* (*D. magna*) acute toxicity testing. Ten of the 235 (4.3%) *D. magna* acute toxicity tests completed in 2017 showed >50% mortality and did not meet Permit 107517 requirement that effluent must not be acutely toxic. There were no failures of the rainbow trout toxicity tests in 2017 (i.e., mortality <50% for the 2017 rainbow trout acute toxicity tests). The results of additional testing, including Toxicity Identification Evaluation tests, tests conducted at different temperature regimes (e.g., 10 and 20°C), removal of toxicity following addition of antiscalant, and observations noted by laboratory staff indicated that reduced survival of *D. magna* may have been caused by precipitate formation on the organism during lab testing. The mineral precipitate is suspected to be calcite; additional work is ongoing to identify the cause(s) of adverse effects observed in *D. magna*. The two locations that account for the majority of *D. magna* toxicity test failures have treatment (West Line Creek) or are planned for treatment (Cataract Creek) to improve water quality. In addition, Teck is committed to addressing the issue of precipitate/calcite management in the valley. Identification of priority tributaries for calcite management as per Permit requirements and permitting to support calcite management is underway.

Other non-compliances were related to missed samples, administrative non-compliances, and hold time exceedances. Improvements in planning (e.g., scheduling of sample collection/shipping around statutory holidays), internal and external communications (e.g., timely reporting), and following standard protocols are anticipated to reduce future non-compliances.

In consideration of the extensive surface water monitoring program required under Permit 107517, in conjunction with all other active monitoring programs, no additional monitoring is proposed at this time. Teck will continue to collect and evaluate surface water monitoring data to provide information required to support Teck's Adaptive Management Plan.

1 Introduction

After consideration of the July 22, 2014, Elk Valley Water Quality Plan (EVWQP) and approval by the Ministry of Environment (ENV) on November 18, 2015, Permit 107517 was issued under provisions of the Environmental Management Act (EMA). Permit 107517 takes an area-based approach to authorizing and managing water quality constituents of interest originating from current and historical mining activities in the Elk Valley. This report was prepared to meet requirements of Permit 107517 dated October 13 of 2017. This report will also be submitted to the Ministry of Energy, Mines & Petroleum Resources (EMPR) as a fulfillment of water quality reporting requirements associated with Teck's mining authorizations in the Elk Valley.

The Elk Valley, located in the southeast corner of British Columbia, is bisected by the Elk River which in turn is fed by a number of tributaries of which the Fording River and Michel Creek are the largest. Primary communities in the Elk Valley include Elkford, Sparwood, Hosmer, Fernie, and Elko. Presently, five steelmaking coal mines are operated by Teck Coal Limited (Teck) within the Elk Valley. They include Fording River Operation, Greenhills Operation, Line Creek Operation, Elkview Operation, and Coal Mountain Operation (Figure 1).

The following report summarizes environmental incidents recorded in 2017, summarizes monitoring data for discharges and receiving environment water sampling sites set forth in Permit 107517, and provides an assessment of the data and associated recommendations, as appropriate.

In addition, as required in Permit 107517 Section 11, Teck has developed an Adaptive Management Plan (AMP) to support implementation of the EVWQP; to achieve water quality targets including calcite targets; confirm that human health and the environment are protected, and where necessary, restored; and to facilitate continuous improvement of water quality in the Elk Valley.

Details on the linkages between the AMP and the surface water monitoring program are provided in Section 6 of this report. Specifically, Section 6 provides details regarding how surface water monitoring data will be utilized to help answer Management Questions 1 and 2. Section 6 also contains a summary of progress made towards developing early warning triggers (EWTs) that are being developed as part of the 2018 AMP update process. Once developed, it is envisioned that water quality EWT will be analyzed and reported on as part of quarterly surface water reports and summarized annually to support the AMP.

1.1 Authorized Discharge and Receiving Environment Water Sampling Sites

Permit 107517 requires the collection of water samples from authorized discharges, receiving environment, and other sampling sites. The relative allocation of water sampling sites per operation in 2017 is as follows, excluding Order Stations and Compliance Points:

- Fording River Operation (FRO) collects samples from 25 sites
- Greenhills Operation (GHO) collects samples from 21 sites
- Line Creek Operation (LCO) collects samples from 12 sites
- West Line Creek Active Water Treatment Facility (WLC) collects samples from 2 sites
- Elkview Operation (EVO) collects samples from 19 sites

- Coal Mountain Operation (CMO) collects samples from 6 sites
- Kooconusa Reservoir for which there are 4 sites

Authorized discharge and receiving environment water sampling sites noted above are numerically identified by dedicated Environmental Monitoring Site (EMS) numbers and corresponding site-specific sampling codes. A summary of sampling sites by operation are presented in Tables 1 through 7 below.

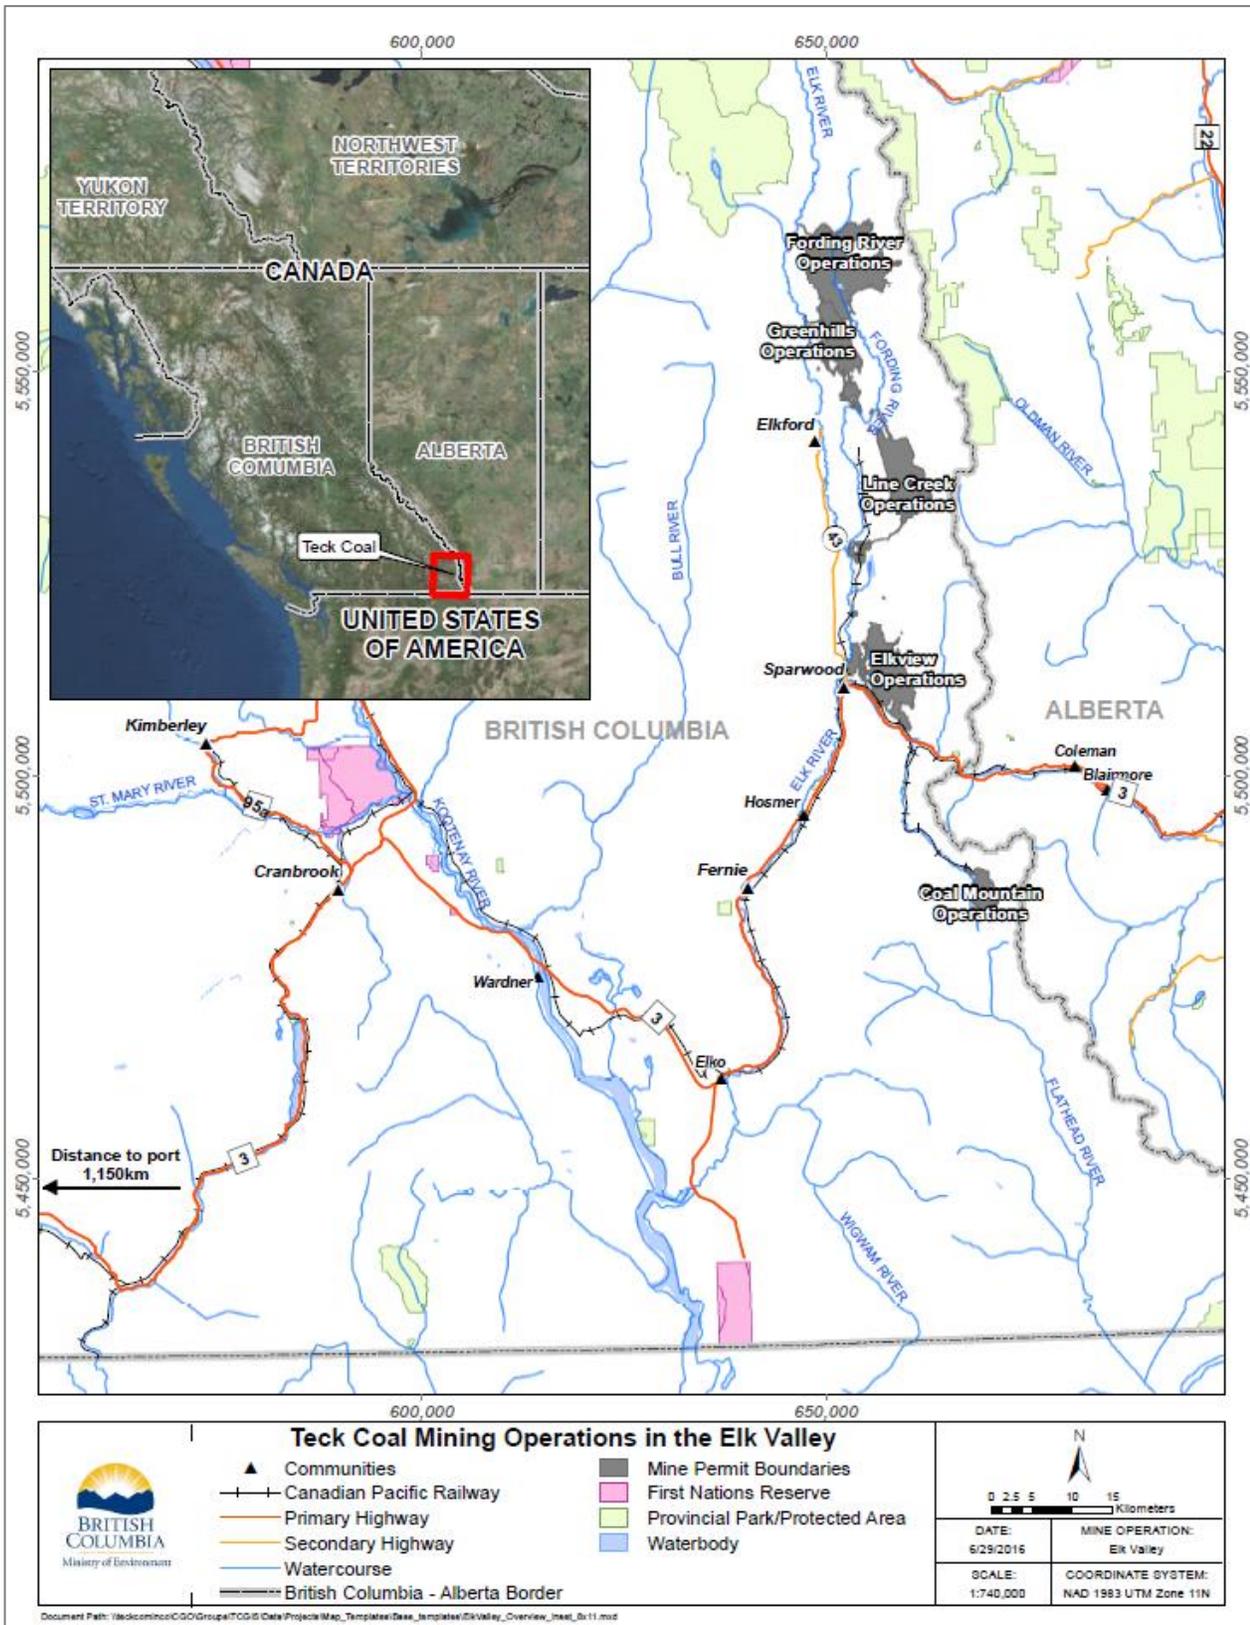

Figure 1. Location of Teck's five steelmaking coal operations within the Elk Valley, British Columbia.

Table 1. Summary of discharge, receiving environment, and other water sampling sites for Fording River Operation based on the version of Permit 107517 dated October 13, 2017.

EMS ID	Site ID	Sampling Site Type	Sampling Site Description
E216777	FR_UFR1	Receiving Environment	Fording River U/S of Henretta Cr.

Note: Environmental Monitoring Site (EMS) identification numbers (IDs) correspond to those listed in the ENV's monitoring data repository.

The spatial location and distribution of authorized discharges and receiving environment water sampling sites for CMO are presented in Appendix K Map 5.

Table 6. Summary of receiving environment water sampling sites for the Koochanusa Reservoir based on the version of Permit 107517 dated October 13, 2017.

EMS ID	Site ID	Sampling Site Type	Sampling Site Description
E300095	RG_KERRRD	Receiving Environment	Koochanusa Reservoir Downstream of Kikkoman Creek
E300092	RG_GRASMERE	Receiving Environment	Koochanusa Reservoir West of Grasmere
E300093	RG_USGOLD	Receiving Environment	Koochanusa Reservoir Upstream of Gold Creek
E300094	RG_BORDER	Receiving Environment	Koochanusa Reservoir Upstream of the Canada/US border

Notes:

1. Environmental Monitoring Site (EMS) identification numbers (IDs) correspond to those listed in the ENV's monitoring data repository.
2. All receiving water sampling sites within the Koochanusa Reservoir are located on lands and waters of Canada.

The spatial location and distribution of receiving environment water sampling sites within the Koochanusa Reservoir are presented in Appendix K Map 6.

Table 7. Summary of water sampling sites for the West Line Creek Active Water Treatment Facility

EMS ID	Site ID	Sampling Site Type	Sampling Site Description
E293370	WL_LCI_SP02	Monitoring	AWTF Influent LC
E293371	WL_WLCI_SP01	Monitoring	AWTF Influent WLC

Note: Environmental Monitoring Site (EMS) identification numbers (IDs) correspond to those listed in the ENV's monitoring data repository.

The spatial location and distribution of authorized discharges and receiving environment water sampling sites for WLC are presented in Appendix K Map 9.

1.1.1 Compliance Points

In addition to the authorized discharges, receiving environment, and other water sampling sites outlined in Section 1.1, eight authorized Compliance Points have also been designated within the Elk Valley. Monitoring data collected at Compliance Points are intended to capture and represent all or most point and non-point discharges from operations, and as such, reflect a total discharge from the operation within the receiving environment. Compliance Points are subject to compliance limits established in Permit 107517. A list of the eight Compliance Points and their dedicated EMS numbers and corresponding site-specific sampling codes is presented in Table 8 below.

Table 8. Summary of authorized discharge compliance points within the Elk Valley.

EMS ID ¹	Site ID	Sampling Site Type	Sampling Site Description ²
E300071	FR_FRCP1	Authorized Discharge	FRO - Fording River, 525 m Downstream of Cataract Creek
200378	GH_FR1	Authorized Discharge	GHO Fording River - Fording River, 205 m Downstream of Greenhills Creek
E300090	GH_ERC	Authorized Discharge	GHO Elk River - Elk River, 220 m downstream of Thompson Creek

EMS ID ¹	Site ID	Sampling Site Type	Sampling Site Description ²
E291569	WL_BFWB_OUT_SP21	Authorized Discharge	WLC - AWTF Outfall (Effluent)
E297110	LC_LCDSSLCC	Authorized Discharge	LCO - Line Creek immediately downstream of South Line Creek Confluence (~1500 m downstream of the WLC WTP outfall)
E102682	EV_HC1	Authorized Discharge	EVO Harmer - Harmer Spillway
E258937	CM_MC2	Authorized Discharge	CMO - Michel Creek, 50 m Upstream of Andy Good Creek
E300091	EV_MC2	Authorized Discharge	EVO Michel Creek - Michel Creek at Highway -3 Bridge

Notes:

1. Environmental Monitoring Site (EMS) identification numbers (IDs) correspond to those listed in the ENV's monitoring data repository.
2. The **bold font** reflects which operation the Compliance Point applies to and is intended to reflect, all or most point and non-point discharges from the Operation (e.g., FRO's Compliance Point is EMS E300071; FR_FRCP1).

The spatial location and distribution of the Compliance Points is presented in Appendix K Map 7.

1.1.2 Order Stations

In addition to the authorized discharges, receiving environment, other water sampling sites, and Compliance Points, Teck collects water samples at seven Order Stations for which Site Performance Objectives (SPOs) have been established. Order Stations are used to monitor water quality in the Elk Valley (i.e., the Designated Area¹), and ultimately the implementation success of the EVWQP. A summary of the Order Stations and their dedicated EMS numbers and corresponding site-specific sampling codes is presented in Table 9 below. The spatial location and distribution of the Order Stations as well as a summary of their status compared to SPOs are presented in Appendix K Map 8.

Table 9. Summary of Order stations within the Elk Valley.

EMS ID	Site ID	Sampling Site Type	Sampling Site Description
0200378	GH_FR1	Receiving Environment / Authorized Discharge	Upper Fording River (Upstream Josephine Falls)
0200028	LC_LC5	Receiving Environment	Lower Fording River (Fording River Downstream of Line Creek)
E206661	GH_ER1	Receiving Environment	Elk River upstream of Boivin Creek (Upstream of Fording River)
0200027	EV_ER4	Receiving Environment	Elk River upstream of Grave Creek (from Fording River to Michel Creek)
200393	EV_ER1	Receiving Environment	Elk River Downstream Michel Creek

¹ The Designated Area as defined within Permit 107517 is: "a portion of southeastern British Columbia that contains the Elk Valley Watershed and the portion of Kooacanusa Reservoir within Canada, and is geographically defined by Ministerial Order M113. References to the Elk Valley are references to the Designated Area.

EMS ID	Site ID	Sampling Site Type	Sampling Site Description
E294312	RG_ELKORES	Receiving Environment	Elk River at Elko Reservoir
E300230	RG_DSELK	Receiving Environment	Koocanusa Reservoir – South of the Elk River

Notes:

1. Environmental Monitoring Site (EMS) identification numbers (IDs) correspond to those listed in the Ministry's monitoring data repository.
2. Water sampling site EMS 200378; GH_FR1 serves both as an Order Station (i.e., receiving environment sampling site), and as a Compliance Point (i.e., authorized discharge) for the Greenhills Operation.

2 Compliance

A number of water quality sampling sites have been established within Permit 107517 to evaluate compliance. The following section summarizes water quality results in comparison to authorized permit limits established for Compliance Points and SPOs established at Order Stations. Environmental non-compliances recorded in 2017 and associated corrective actions are also summarized.

2.1 Effluent Limits and Site Performance Objectives at Compliance Points

As noted in Section 1.1.1, eight Compliance Points have been designated within the Elk Valley. The intent of each Compliance Point is to capture and reflect, all or most point and non-point discharges from an operation, and as such, reflect an accumulated (i.e., integrated) discharge from that operation. A summary of the eight Compliance Points and their respective discharge effluent limits is presented in Table 10 below.

Table 10. Authorized discharge effluent limits established at Compliance Points within the Elk Valley (2017).

EMS ID ¹	Site ID	Constituent	Monthly Average Limit	Daily Maximum Limit ²
E300071	FR_FRCP1	Total Selenium	130 µg/L	155 µg/L
		Nitrate-N	27 mg/L as N	32.5 mg/L as N
		Sulphate	580 mg/L	-
0200378	GH_FR1	Total Selenium	80 µg/L	100 µg/L
		Nitrate-N	20 mg/L as N	29 mg/L as N
E300090	GH_ERC	Total Selenium	15 µg/L	-
		Nitrate-N	3 mg/L as N	-
E297110	LC_LCDSSLCC	Total Selenium	50 µg/L	58 µg/L
		Nitrate-N	7 mg/L as N	9 mg/L as N
E291569	WL_BFWB_OUT_SP21	Ammonia	-	1.0 mg/L
		Biological Oxygen Demand	-	25 mg/L
		pH range	-	6.5-8.5
		Nitrate	-	3.0 mg/L
		Total Phosphorus	-	0.3 mg/L
		Total Selenium	0.02 mg/L	-
		Total Suspended Solids	-	10.0 mg/L
E102682	EV_HC1	Total Selenium	45 µg/L ³	-
		Nitrate-N	4 mg/L as N ³	-
		Sulphate	300 mg/L ³	-
E300091	EV_MC2	Total Selenium	28 µg/L	-
		Nitrate-N	6 mg/L as N	-
E258937	CM_MC2	Total Selenium	19 µg/L	-
		Nitrate-N	5 mg/L as N	-
		Sulphate	500 mg/L	-

Notes:

1. Environmental Monitoring Site (EMS) identification numbers (IDs) correspond to those listed in the Ministry's monitoring data repository.
2. These limits apply to data collected and reported on in 2017.

In addition to the above-listed effluent limits, four specified Compliance Points (0200378 (GH_FR1), E300090 (GH_ERC), E297110 (LC_LCDSSLCC) and E300091 (EV_MC2) are required to maintain SPOs for sulphate per the following water hardness (expressed in terms of calcium carbonate (CaCO₃)) dependent relationship:

Table 11. Sulphate SPO at various water hardness values expressed as CaCO₃.

Water Hardness (mg/L CaCO ₃)	SO ₄ SPO (mg/L)
Very soft (<30)	128
Soft to moderately soft (31-75)	218
Moderately soft/hard to hard (76-180)	309
Very hard (181-250)	429
Very Hard (>250)	429

All Compliance Points are expected to maintain the following hardness dependant SPO for cadmium:

$$\text{Cadmium (Cd): } Cd (\mu\text{g/L}) = 10^{0.831 \log(\text{hardness}) - 2.53}$$

A summary of 2017 water quality data recorded at Compliance Points relative to the above-listed limits is presented in Figures 2 to 22. Exceedances in effluent limits (i.e., non-compliances) are discussed in Section 2.3.

Compliance Point E300071 (FR_FRCP1)

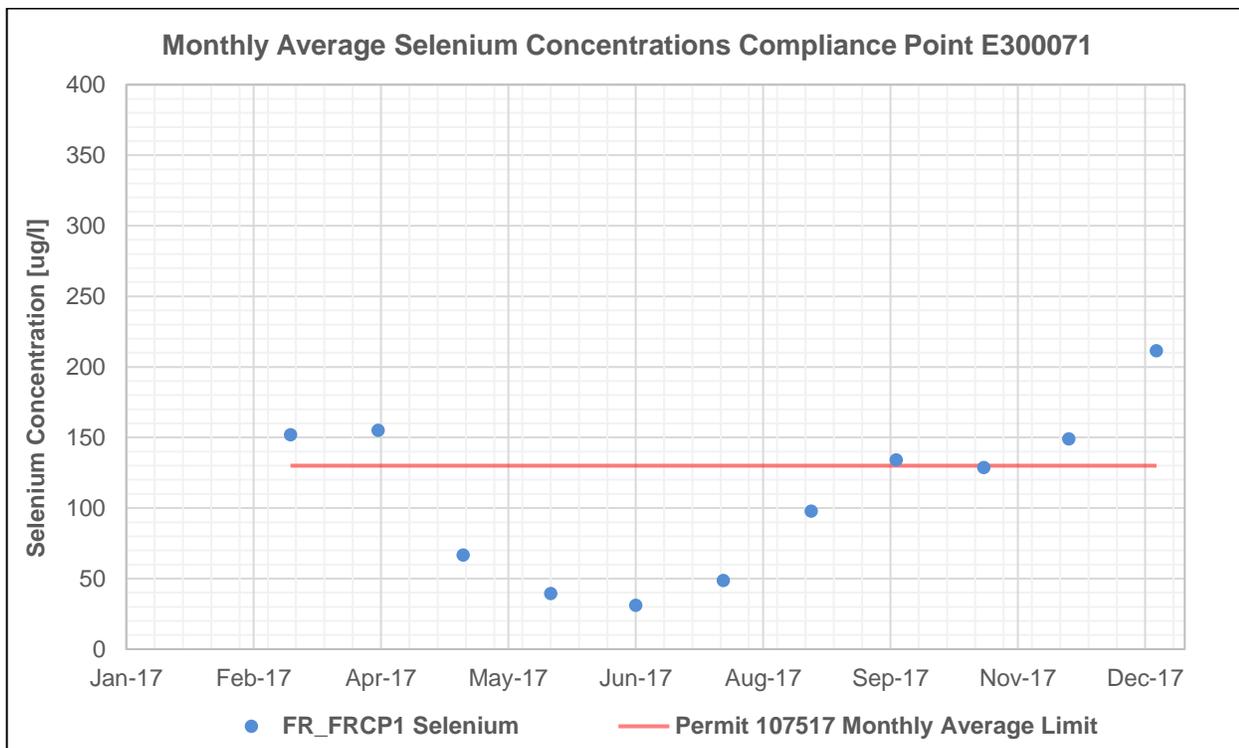

Figure 2. Monthly average total selenium concentrations recorded at Fording River Operation Compliance Point E300071 (FR_FRCP1).

Note: The monthly average compliance limit for total selenium was exceeded in March, November, September, and December and is discussed in Section 2.3.

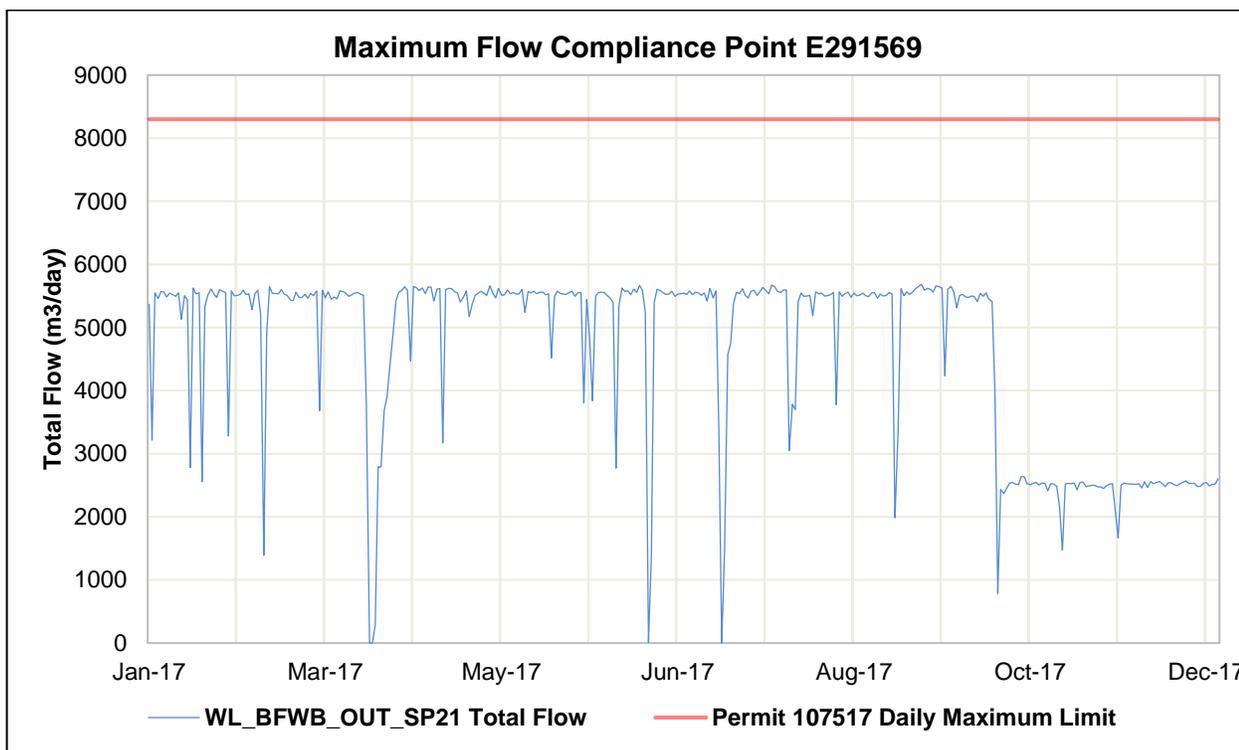

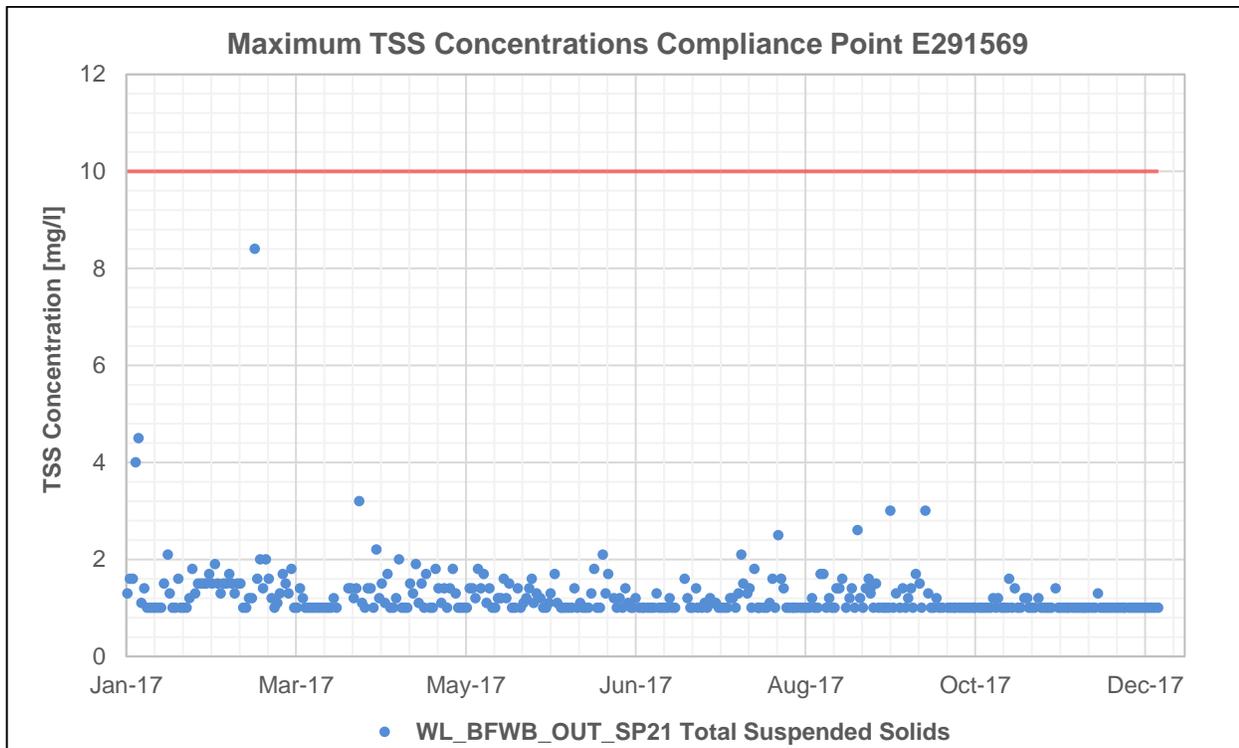

Figure 22. Total suspended solids maximum concentrations (top panel) and total flows (bottom panel) recorded at the West Line Creek Active Water Treatment Facility Compliance Point E291569 (WL_BFWB_OUT_SP21).

2.2 Site Performance Objectives at Order Stations

As noted in Section 1.1.2, seven Order Stations have been designated to monitor water quality in the Elk Valley (i.e., the Designated Area), and ultimately evaluate the implementation success of the ABMP. To aid in this evaluation, short-, medium-, and long-term SPOs have been established at each Order Station. SPOs are required to be attained by the outlined timeframes. A summary of the Order Stations and their respective short-term SPOs are presented in Table 12 below.

Table 12. Short-term site performance objectives established at Order stations within the Elk Valley.

EMS ID	Site ID	Constituent	Monthly Average SPO	Timeframe
0200378	GH_FR1	Total Selenium	63 µg/L	December 31, 2019
		Nitrate-N	20 mg/L as N	Immediately
		Sulphate	429 mg/L	Immediately
		Dissolved Cadmium	0.39 µg/L	Immediately
0200028	LC_LC5	Total Selenium	51 µg/L	December 31, 2019
		Nitrate-N	18 mg/L as N	Immediately
		Sulphate	429 mg/L	Immediately
		Dissolved Cadmium	0.39 µg/L	Immediately
E206661	GH_ER1	Total Selenium	19 µg/L	Immediately
		Nitrate-N	3 mg/L as N	Immediately
		Sulphate	309 mg/L	Immediately
		Dissolved Cadmium	0.24 µg/L	Immediately
0200027	EV_ER4	Total Selenium	23 µg/L	Immediately
		Nitrate-N	4 mg/L as N	December 31, 2019
		Sulphate	429 mg/L	Immediately
		Dissolved Cadmium	0.24 µg/L	Immediately
0200393	EV_ER1	Total Selenium	19 µg/L	Immediately
		Nitrate-N	3 mg/L as N	December 31, 2019
		Sulphate	429 mg/L	Immediately
		Dissolved Cadmium	0.24 µg/L	Immediately
E294312	RG_ELKORES	Total Selenium	19 µg/L	Immediately
		Nitrate-N	3 mg/L as N	December 31, 2019
		Sulphate	429 mg/L	Immediately
		Dissolved Cadmium	0.24 µg/L	Immediately
E300230	RG_DSELK	Total Selenium	2 µg/L	Immediately
		Nitrate-N	3 mg/L as N	Immediately
		Sulphate	308 mg/L	Immediately
		Dissolved Cadmium	0.19 µg/L	Immediately

Notes:

1. Environmental Monitoring Site (EMS) identification numbers (IDs) correspond to those listed in the Ministry's monitoring data repository.
2. As was the case for effluent limits developed for Compliance Points, SPOs for cadmium are hardness dependent and for purposes herein have been set at 360 mg/L as CaCO₃ (sites 0200378, 0200028, and E206661), 200 mg/L as CaCO₃ (sites 0200027, 0200393, and E294312), and 150 mg/L as CaCO₃ (site E300230), respectively.

A summary of 2017 water quality data recorded at Order Stations relative to current SPOs are presented in Figure 23 (0200378; GH_FR1), Figure 24 (0200028; LC_LC5), Figure 25 (E206661; GH_ER1), Figure 26 (0200027; EV_ER4), Figure 27 (0200393; EV_ER1), Figure 28 (E294312; RG_ELKORES), and Figure 29 (E300230; RG_DSELK).

All of the above-mentioned figures have been set-up and presented in a consistent format. Specifically, each figure is divided into four quadrants (panels) with nitrate-N concentrations appearing in quadrant 1 (top right panel), total selenium in quadrant 2 (top left panel), sulphate in quadrant 3 (bottom left panel), and dissolved cadmium in quadrant 4 (bottom right panel). Based on review and input from the EMC regarding the 2016 annual report, future SPOs have been included in the figures below for Order Stations that do not have a current SPO associated with them at this time. These future SPOs are represented by a dashed blue line and the dates that they will come into effect are indicated in the legend of the figure. Based on 2017 data and as illustrated within Figures 23 through 29, current SPOs were attained at all Order Stations.

Order Station E300230 (RG_DSELK)

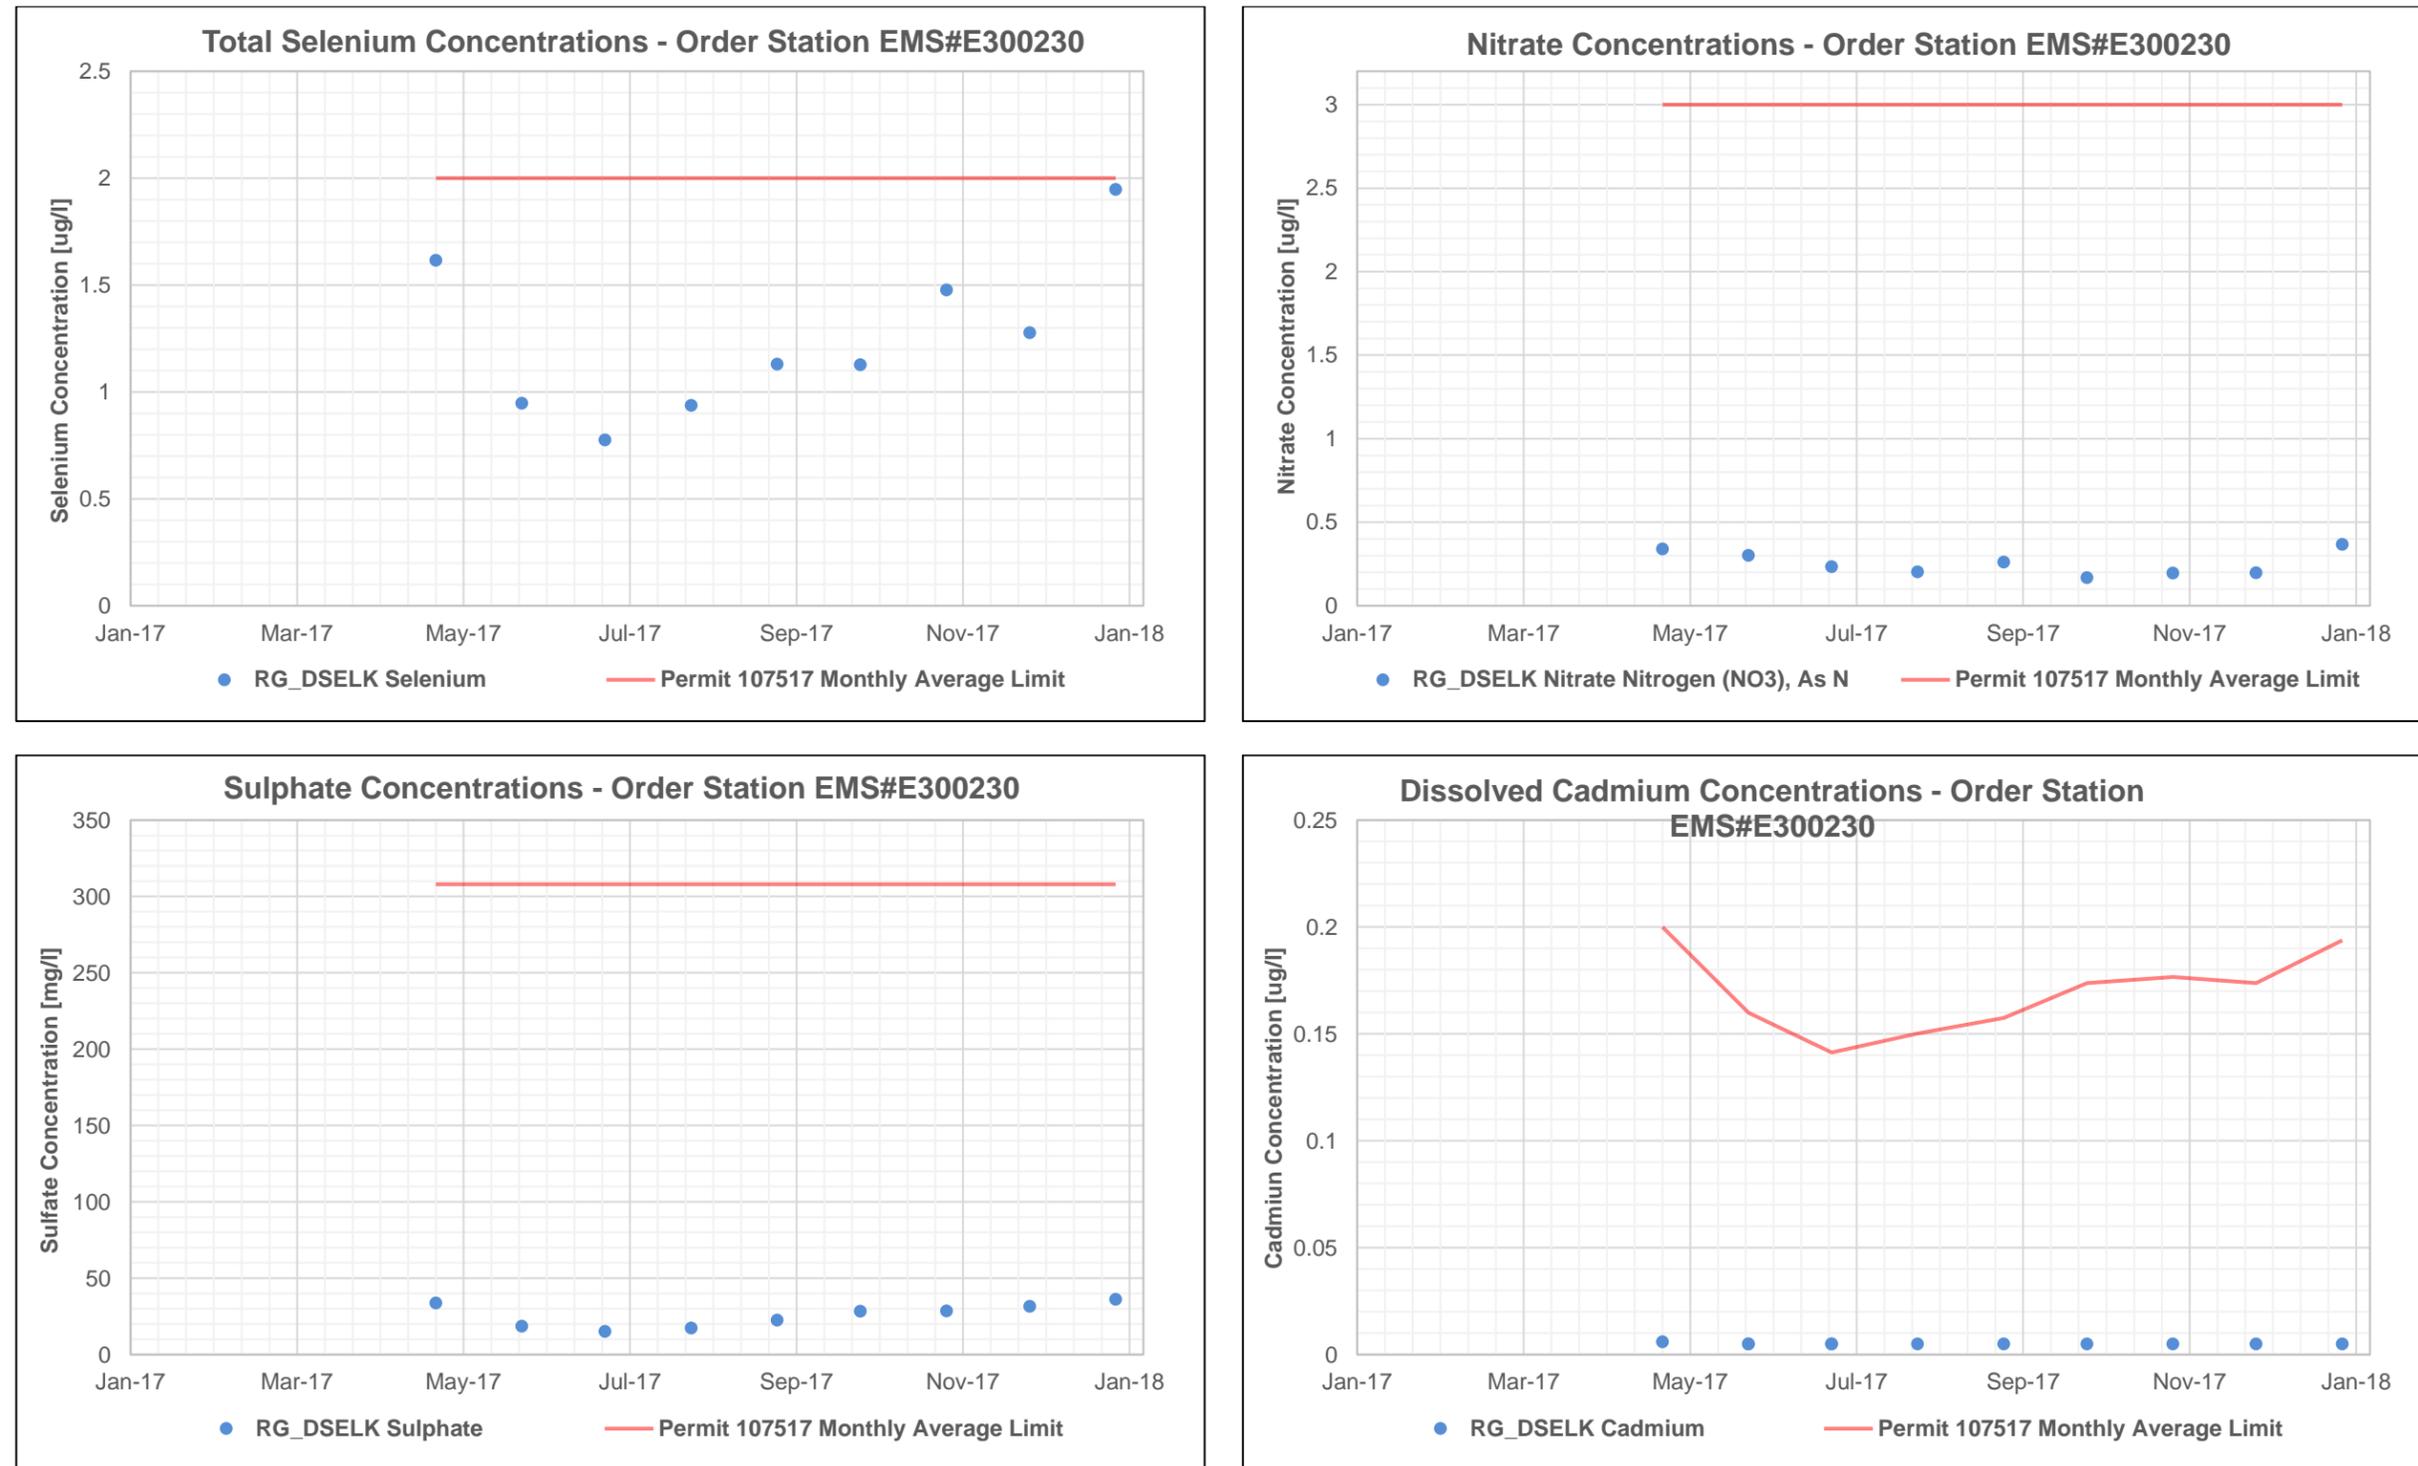

Figure 29. Plot of monthly average total selenium, nitrate-N, sulphate, and dissolved cadmium concentrations relative to site performance objectives recorded at Order Station E300230 (RG_DSELK).

Note: Samples in January, February and March of 2017 were unattainable due to ice conditions on the Koochanusa Reservoir.

2.3 Non-Compliances

Permit non-compliances in 2017 are grouped under the following categories for ease of interpretation; category 1) Compliance Point exceedances, category 2) discharge location acute toxicity failures, category 3) missed sample collection, category 4) administrative non-compliances, (i.e., late reporting or failure to upload data to ENV EMS database), and category 5) hold time exceedances.

2.3.1 Compliance Point/Order Station Limit/SPO Exceedances (Category 1)

In 2017, compliance limit exceedances were recorded for selenium, sulphate and/or nitrate at three Compliance Points, E300071 (FR_FRCP1), E297110 (LC_LCDSSLCC), and E258937 (CM_MC2). At these three locations, 74 results had selenium, sulphate or nitrate concentrations that were higher than the limits, which constitutes a total of 9.8% of all samples taken for parameters with compliance limits as identified in section 2.0 of Permit 107517. In total, 755 samples were collected in 2017 at Compliance Points with 681 (90.2%) below permit limits. A summary of exceedances by analyte is shown in Figure 30 and a summary by location is shown in Table 13.

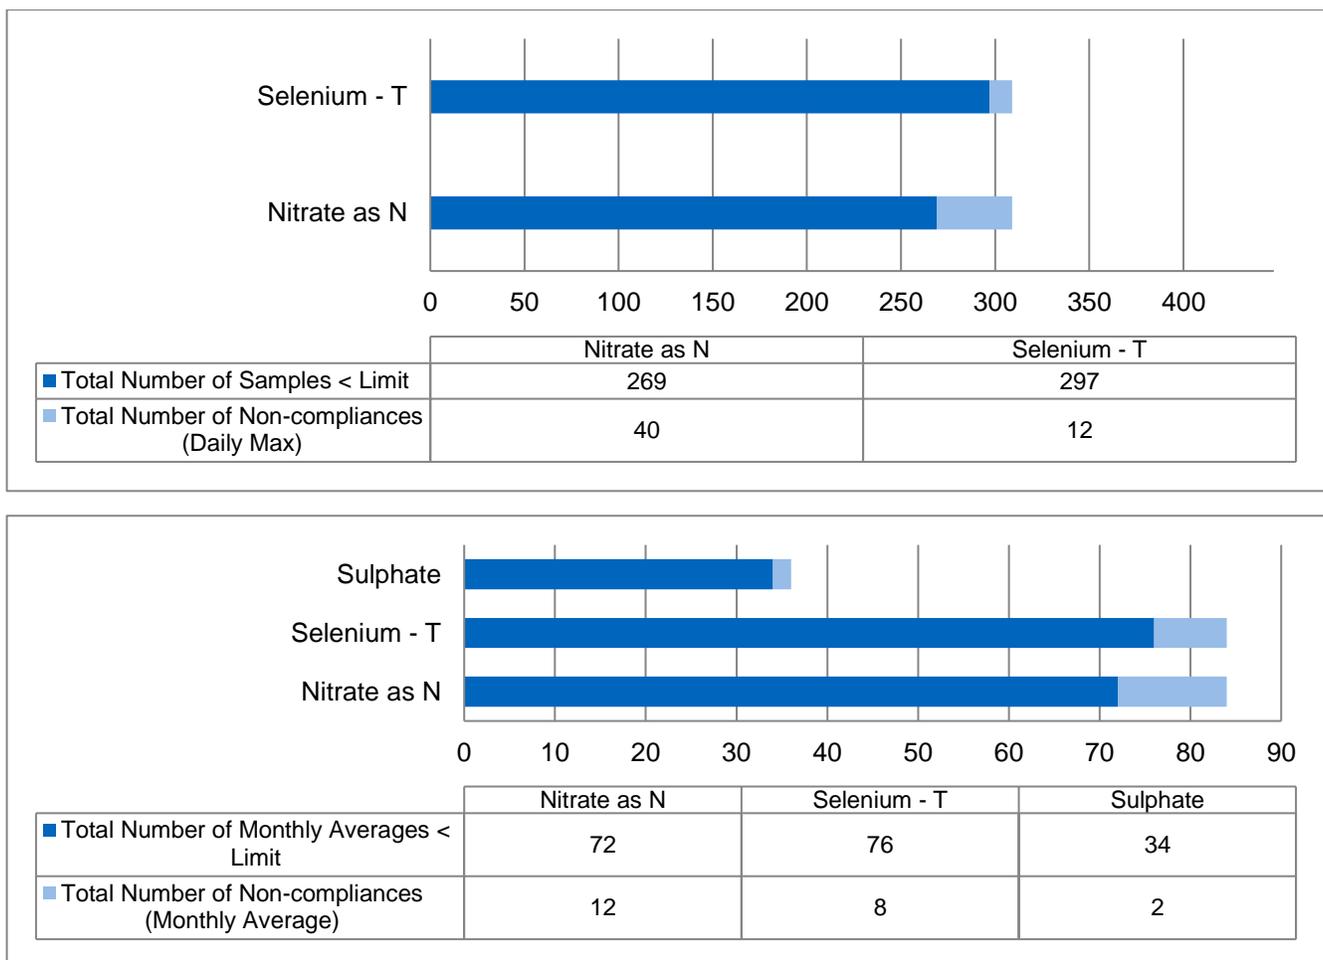

Figure 30. Summary of daily maximum (top panel) and monthly average (bottom panel) compliance limit exceedances by analyte compared to total samples taken and total monthly averages at Compliance Points in 2017.

Table 13. Summary of 2017 exceedances at Compliance Points.

EMS ID	Site ID	Permitted Constituent and Limit	Recorded Concentrations	Date of Exceedance	% of Samples Collected Above Permit Limits
E258937	CM_MC2	Monthly Average – (NO ₃) = 5 mg/L as N	6.0	January	8%
E300071	FR_FRCP1	Daily Maximum – (Se) = 155 µg/L	312	7-Mar	14%
		Daily Maximum – (Se) = 155 µg/L	180	4-Dec	
		Daily Maximum – (Se) = 155 µg/L	178	6-Dec	
		Daily Maximum – (Se) = 155 µg/L	274	12-Dec	
		Daily Maximum – (Se) = 155 µg/L	214	28-Dec

		Monthly Average – (Se) = 50 µg/L	51.0	October	
		Monthly Average – (Se) = 50 µg/L	58.0	November	
		Monthly Average – (Se) = 50 µg/L	60.0	December	

LC_LCDSSLCC – EMS # E297110

As outlined within Table 13, the majority of the 74 non-compliances (61 of the 74 exceedances) were associated with Compliance Point LC_LCDSSLCC.

With respect to the selenium non-compliances, Teck has been working to address a challenge in the performance of our West Line Creek Active Water Treatment Facility (WLC AWTF) related to compounds of selenium in discharge water. Teck reduced the flow rate of the WLC AWTF from 5,500 m³/day to 2,500 m³/day on October 17th, 2017, limiting the amount of selenium that is removed from Line Creek. This change in treatment volume increased selenium concentrations downstream in Line Creek, resulting in exceedances at the LCO Compliance Point. This is explained in further detail under Section 6.4 which discusses the Active Water Treatment process performance in 2017.

On September 14, 2017, Teck submitted a Compliance Action Plan (CAP) which outlines the path forward to support permit compliance with nitrate limits in Line Creek. The CAP was approved on January 9, 2018 and was developed with input from ENV and the Ktunaxa Nation Council (KNC), the approved CAP identifies objectives, key performance indicators (KPIs), and actions that Teck has taken and will take to reduce nitrate concentrations at this Compliance Point. The CAP will be updated as required to incorporate learnings from monitoring results and the 2017 RWQM update. This information will be used to make adjustments to the objectives and KPIs (including additional measurable metrics) to support reduction of nitrate concentrations in Line Creek. The CAP also supports Teck's commitment to continue with the implementation of the EVWQP to improve water quality in Line Creek and the Elk River watershed. Reporting on the progress and status of the CAP occurs quarterly.

Compliance limits for nitrate at LC_LCDSSLCC were initially defined based on modelling the limited data that was available at this location at the time of developing the EVWQP and commissioning schedule for the West Line Creek Active Water Treatment Facility. Since that time, additional monitoring data indicates that the Regional Water Quality Model (RWQM) was not adequately projecting the nitrate loading in Line Creek. The 2017 RWQM update included revised geochemical source terms and an updated conceptual model of waste rock hydrology which is numerically represented by the incorporation of a lag between waste rock placement and the appearance of mining related constituents in the receiving environment. These updates to the RWQM resulted in improved calibration of modelled historical nitrate concentrations to historical monitoring data in Line Creek and changed the magnitude and patterns of the projected concentrations in Line Creek. The updated Regional Water Quality Model projections show concentrations of nitrate continuing to increase in Line Creek until 2023 at which point they will start to decrease. These projections do not consider recent improvements to blasting practices and additional activities associated with the LCO Compliance Action Plan which are expected to decrease concentrations of nitrate in Line Creek. Concentrations of nitrate at the first downstream Order Station in the Fording River (FR5, LC_LC5) have remained below the SPO.

FR_FRCP1 – EMS# E300071

Compliance Points are intended to monitor fully mixed conditions in the receiving environment (i.e., main stem river) of all or most of the direct or indirect discharges from one mine operation. Water quality and quantity monitoring data have indicated that surface water at FR_FRCP1 is predominantly discharge water from the mine-impacted Cataract Creek during low flow months. At Compliance Point FR_FRCP1, permit limits were exceeded during low flow periods in 2017; however, monitoring data and additional analysis by ENV confirmed that isolated surface water flow at the Compliance Point is predominantly discharge water from Cataract Creek during low flow.

Teck is currently working on an adjustment to the EVWQP implementation plan and is advancing design for the FRO-S AWTF which is planned to treat water from Cataract, Swift and Kilmarnock creeks and directly reduce concentrations of selenium and nitrate at the Compliance Point. Teck is also compiling the information requested by ENV to support the submission of an application to amend Permit 107517 and move the Fording River Compliance Point to a location that is more suitable for assessing compliance with Permit 107517.

CM_MC2 – EMS# E258397

In January 2017, a non-compliance occurred at the CMO Compliance Point, CM_MC2. Pit dewatering activities in January were similar to other months (i.e., pumping rates and concentrations) but creek flows decreased which resulted in an exceedance of the nitrate permit limit. Pumping rates were immediately adjusted to bring nitrate concentrations back within permit limit. Concentrations for the remainder of the year remained within permit limits.

2.3.2 Acute Toxicity Failures (Category 2)

In addition to non-compliances resulting from water quality concentrations exceeding permit limits, 10 non-compliances due to failed *Daphnia magna* (water flea) acute toxicity tests were recorded in 2017. A total of 235 *Daphnia magna* acute toxicity tests were completed in 2017 associated with Permit 107517 locations resulting in a failure rate of 4.3%. Of the 210 samples collected for Rainbow Trout acute toxicity tests, there were no toxicity failures in 2017. These results are discussed in more detail in Section 5.3 of this report.

2.3.3 Missed Samples (Category 3)

Missed samples were the result of failed field equipment, scheduling errors and/or lab error. A chronological summary of 2017 missed sample non-compliances are provided in Table 14. Missed sample data represent about 27 of 213,788 or 0.01% of surface water data points collected at Permit 107517 locations in 2017 and are not expected to affect the quality of data analysis. Although non-compliances for missed samples represent only a fraction of the monitoring program, Teck continues to implement new and updated management practices to further reduce instances of missed samples. These include, updated database programming to assist in creation of sample plans, improved data management practices and QA/QC measures to indicate when a sample is missed as to allow for re-

sampling to be scheduled with in the sampling session, and improved communications with laboratories to identify sample analysis issues that will also allow for resampling.

Table 14. Summary of 2017 missed samples for Permit 107517.

Date	EMS ID	Location Code	Parameters	Reason
1/17/2017	E258937	CM_MC2	Flow	In the Q2 EMS data upload, flow was not provided for this location.
2/23/2017	E298592	EV_BLM2	Dissolved ultra-trace mercury	Samples were not filtered by the laboratory before being preserved.
2/23/2017	E102681	EV_SM1	Dissolved ultra-trace mercury	Samples were not filtered by the laboratory before being preserved.
2/23/2017	E296311	EV_SP1	Dissolved ultra-trace mercury	Samples were not filtered by the laboratory before being preserved.
2/23/2017	E208057	EV_MG1	Dissolved ultra-trace mercury	Samples were not filtered by the laboratory before being preserved.
2/23/2017	E298594	EV_SPR2	Dissolved ultra-trace mercury	Samples were not filtered by the laboratory before being preserved.
2/23/2017	E200097	EV_EC1	Dissolved ultra-trace mercury	Samples were not filtered by the laboratory before being preserved.
3/15/2017	E200209	CM_CC1	All field parameters	Teck's internal data management system was not updated from field notes taken at the time of sample collection. The field notebook is now unattainable.
4/5/2017	200393	EV_ER1	Dissolved oxygen	Incorrect value was recorded in the field. This was not noticed until the next sample session.
5/2/2017	E298733	CM_PC2	Missing select lab parameters	The chain of custody parameters were selected incorrectly therefore were not included in the analysis.
5/9/2017	E102709	GH_GH1	Flow	A flow measurement was attempted however; an authorized fish barrier was obstructing the measurement.
5/23/2017	0200385	GH_PC1	Flow	A flow measurement was attempted; however, the sampling crew felt it was unsafe to proceed due to high water velocity.
5/29/2017	E216778	FR_HC1	TSS & turbidity	Sample analysis omission during log-in procedure at lab.
6/6/2017	E298733	CM_PC2	Missing select lab parameters	The chain of custody parameters were selected incorrectly therefore were not included in the analysis.
6/21/2017	E258937	CM_MC2	Dissolved oxygen	Dissolved oxygen was collected at the time however the measurement was incorrect (113.7 mg/L).
Q3	E298733	CM_PC2	Acute toxicity	Not sampled on July 5, which was the only week within the quarter when flow was present.
7/4/2017	E206439	CM_SEW	Turbidity	Turbidity was not analyzed by Lab due to COC naming convention error.
8/2/2017	E282149	LC_SLC	BOD	Sampling conducted on 8/2/2017 and all other parameters were collected. However the chain of custody did not have BOD listed as a requested analysis for this sample location.

2.3.4 Administrative Non-Compliances (Category 4)

There were three non-compliances in 2017 for failure to upload monitoring data to the ENV EMS database. The permit states that the Permittee must submit the results of the discharge and receiving environment water sampling program directly into the ENV EMS database using the appropriate EMS site identification numbers within 30 days of the end of the quarter in which the samples were collected. Upon discovery of these non-compliances, the data were immediately uploaded and additional training and clarification of the permit requirements was provided to staff to prevent future instances.

2.3.5 Hold Time Exceedances (Category 5)

Parameter hold times were exceeded on multiple samples in 2017 (549 out of 213,557 analysis or 0.26% of all analysis completed in 2017). This was an improvement from 2016 in which there were 884 hold time exceedances, resulting in a reduction of 335 instances in 2017. These were generally time-sensitive water quality parameters such as nitrate-N, nitrite-N, turbidity, phosphorous, and total suspended solids. Exceeding hold times may affect the reliability of the sample result in different ways depending on environmental conditions and contents of the sample. A complete list of all hold time exceedances can be found in Appendix D with a more detailed summary provided in Section 3.3, QA/QC issues. It should be noted that the total number of hold time exceedances (549 in 2017) does not equate to 549 non-compliances. Many of these parameters were resampled during the sampling session and therefore met all requirements of the permit. Several others were due to laboratory QA/QC procedures, in which case, the original sample was analyzed within hold times but failed QA/QC. In these instances, the sample is re-run but the second analysis was conducted outside of the hold time. Standard laboratory procedure is to report the data that passed QA/QC but failed the hold time rather than reporting the original result that failed QA/QC.

In 2017, Teck conducted an internal investigation in consultation with the sample shipping contractors and analytical laboratories. The exceedances were a result of several factors including inadequate communication regarding laboratory equipment malfunction, shipping delays, miscommunication between Teck and laboratories, and limited laboratory resources. These factors caused final laboratory result reporting delays in which Teck was not notified of hold time exceedances until after the monthly sampling session was over and re-sampling could not be conducted within the required permit sampling frequency.

The following practices and procedures have been implemented in order to reduce hold time exceedances and expedite the laboratory reporting in the event that there are unpreventable hold times but will allow for re-sampling to be conducted within the sampling session to meet the compliance requirement for that time period.

- Five business days after sample receipt by the Lab, Teck will receive either:
 - The final report containing all data. This is the primary goal.
- or

- A preliminary report containing data that has complete analysis and hold time notifications as well as reasoning as to why there is a delay in the remaining data.

This process will allow for resampling due to hold-time exceedance to be conducted within the sampling session. Additional program improvements include:

- The shipping contractor will send email notification of late deliveries, which will allow Teck to follow up specifically on individual shipments.
- Parameters that have prolonged analysis and cause a delay in reporting will be submitted to the lab on a separate chain of custody (COC). Analysis on select parameters can delay reporting by up to 3 weeks. Having these samples on their own COC will allow for all other data and exceedances to be reported on time.

2.4 Unattainable Sample Data

During the course of the calendar year there are a number of circumstances that prevent the collection of water samples from permitted sampling sites. Such circumstances are generally out of Teck's control and include, but are not necessarily limited to, unsafe sampling conditions for personnel, no flow due to frozen conditions, or cessation of discharge activities. Although such circumstances prevent Teck from collecting water samples at specified EMS sites and/or at the frequencies outlined in Tables 9 through 24 of Appendix 2 in Permit 107517, these unattainable samples do not result in non-compliances, but rather are recorded as unattainable data.

The most common unattainable data parameter is flow. During winter months when there is significant snow accumulation and ice cover it may be unsafe or unrealistic to clear the entire channel to collect an accurate flow measurement or staff gauge reading. The following protocols are implemented where practical to reduce likelihood of unattainable samples.

If the ice and snow cannot be safely cleared to collect an accurate flow and flow is the only parameter that is missed (all other water quality parameters were collected):

- This is not considered a non-compliance nor a missed sample. All other lab and field data are uploaded to ENV EMS database with a comment indicating that flow was not collected due to ice cover and safety concerns.
- Returning to the location later in the sampling period to attempt to collect flow is not required (if water quality parameters were collected during initial visit). Collecting spikes in flow during winter months is not required for the purpose of modeling or determining base winter flows. The flow data that is collected before and after freeze up will be used to estimate winter flows for that location.

There are additional circumstances in which a monthly flow measurement must be collected at certain locations if it is safe to do so. Stations that have continuous flow monitoring requirements and freeze over in the winter do require a manual flow measurement to be collected monthly in order to maintain a continuous record of flow during times when continuous monitoring is not available. This will result in an "estimated" data grade but will maintain compliance with the continuous flow requirement.

There are also several sample sites that have been identified in the Regional Surface Flow Monitoring Plan as critical locations for collecting low flow data in order to improve local scale modelling, design criteria for active water treatment facilities, as well as to provide data for the update to the RWQM as required by Permit 107517. Measurements are required to capture the minimum annual flow at these locations to provide appropriate data that will support the internal Teck data uses as well as permit requirements outlined in the Regional Surface Flow Monitoring Plan.

If a flow measurement as required on either a continuous or monthly/weekly basis cannot be collected due to safety or ice buildup, the proper documentation must be collected to prove that reasonable effort was made to collect the sample. This should include but is not limited to, specific reasons as to why the flow measurement is not available, alternative flow measurement methods considered, and photo documentation. The site must be visited as per the sampling requirements outlined in the permit to collect this information. If these steps are followed and reasonable effort to collect the sample has clearly been displayed, this will be considered compliant with the monitoring requirements for flow as it meets the objectives of the Regional Surface Flow Monitoring Plan.

Teck's priority is worker safety and accepts that samples are not always attainable. A summary of all unattained samples is presented in Appendix A.

3 Surface Water Monitoring Program

As outlined in Permit 107517, water samples are regularly collected from authorized discharges and receiving environment sampling sites. In addition to evaluating compliance as discussed in Section 2, water sampling sites and associated data are used to evaluate overall water quality at point source discharges and within the receiving environment. The following section summarizes water quality/quantity monitoring requirements, methodologies employed in data collection, and quality assurance/quality control (QA/QC) activities.

3.1 Surface Water Monitoring Program

Surface water sampling activities are carried out over a range of frequencies throughout the calendar year (e.g., weekly, monthly, quarterly etc.), with samples analyzed for a number of water quality parameters including:

- **Field Parameters** - water temperature, specific conductance, dissolved oxygen, pH, flow.
- **Conventional Parameters** - specific conductance, total dissolved solids, total suspended solids, hardness, alkalinity, dissolved organic carbon, total organic carbon, turbidity, BOD.
- **Major Ions** - bromide, fluoride, calcium, chloride, magnesium, potassium, sodium, sulphate, sulphide.
- **Nutrients** - ammonia, nitrate, nitrite, TKN, orthophosphate, total phosphorus.
- **Dissolved Metals** - aluminum, antimony, arsenic, barium, beryllium, bismuth, boron, cadmium, chromium, cobalt, copper, iron, lead, lithium, manganese, mercury, molybdenum, nickel, selenium, silver, strontium, thallium, tin, titanium, uranium, vanadium, and zinc.

- **Total Metals** - aluminum, antimony, arsenic, barium, beryllium, bismuth, boron, cadmium, chromium, cobalt, copper, iron, lead, lithium, manganese, mercury, molybdenum, nickel, selenium, silver, strontium, thallium, tin, titanium, uranium, vanadium, and zinc.

Note that not all parameters are collected at all locations or at the same frequency. For specific sampling requirements and frequency related to each monitoring location please refer to Appendix B. Surface water flows and toxicity tests (acute and chronic) are also routinely conducted at a number of sampling sites as per Permit 107517 and the approved Regional Surface Flow Monitoring Plan. All monitoring data collected in 2017 have been tabulated and is included in Appendix I.

3.2 Quality Assurance/Quality Control Program

A QA/QC program has been established to promote consistency in field protocols and methodologies, and the collection of high quality environmental data. Sampling activities are not only carried out to meet the requirements of the monitoring program, in terms of location and frequency, but to collect representative samples and minimize the potential for deterioration and/or contamination prior to laboratory analysis.

Teck conducts and manages a multitude of environmental monitoring programs and depends on data generated by those programs to support environmental protection, inform decisions, and allow for effective management activities. It is imperative that Teck's data quality objectives (DQOs) are implemented and utilized as the driver for all data collection programs and quality assurance and control objectives. The minimum DQO applied to all environmental data is described below.

3.2.1 Teck Data Quality Objectives

Teck Coal has developed standard DQOs that are primarily driven by permit requirements or dictated by provincial and federal legislation. DQOs establish standards on how data are collected, analyzed, managed and stored in a manner that will provide complete and dependable data.

Typically, data can be categorized by the following criteria:

Category 1. Data of Known Quality. Category 1 data are of known quality and are considered to be acceptable for use in decision making. There is sufficient information on these data sets to confidently verify that the data, along with associated data qualifiers, accurately represent chemical concentrations present at the location at the time of sampling.

Category 2. Data of Partially Known Quality. Category 2 data have a limited body of supporting QA/QC information. Although not sufficient to be considered Category 1, the level of quality information is considered suitable for qualitative use. These data sets may be considered for further evaluation based on project - specific DQOs and intended end uses.

Category 3. Data of Unknown Quality. Category 3 data include sample concentration information, but lack an adequate level of supporting QA/QC information. These data sets are not considered suitable for detailed project uses. However, considering the reputability of the data sources, these

data sets may be used on a limited or provisional basis for qualitative comparisons with Category 1 and Category 2 data sets.

Teck's DQO is to collect and produce Category 1 and 2 data at all times. If data are categorized as data of unknown quality (Category 3), it is not suitable for use. The DQOs are met by developing and implementing sampling and data management procedures in accordance with provincial standards. The 2013 Edition of the British Columbia Field Sampling Manual (Clark, M.J.R. (editor). 2002²) is utilized to meet this standard for sampling associated with this permit.

3.2.2 Quantifying DQOs

In order to evaluate and therefore categorize data as outlined above, Teck conducts standard QA/QC duplicate sampling and utilizes relative percent difference (RPD) calculations in order to determine the validity or category of each data point. Teck utilizes the precision criteria outlined in the BC Field Sampling Manual. Additional requirements or more stringent RPD criteria may be developed in the DQO generation process at the onset of individual data collection programs.

Teck's internal database software, EQUiS, is configured to run RPD reports and results are tabulated and assessed. RPD results are assigned a pass/fail grade with multiple levels associated with a passing grade. These correlate to the categories as described above.

In comparing two sets of results, RPD is calculated as the arithmetic difference divided by the mean of the two samples then multiplied by one hundred to express the result as a percentage:

$$\text{RPD} = (\text{Difference}/\text{Mean}) \times 100\%$$

Or, shown differently:

$$\text{RPD} = \left(\frac{(a - b)}{(a + b) / 2} \right) \times 100\%$$

RPD results are described below including follow up actions required by the Data Manager when reviewing RPD data.

- RPD of <20% = Pass, Category 1
 - No action required. Data point is considered validated.
- RPD of >20% with results < 5 times the detection limit = Pass, Category 1
 - No action required. Measurement is not considered quantitatively meaningful.
- RPD of >20% and <50% with results >5 times the detection limit = Pass, Category 2

² Clark, M.J.R. (editor). 2002. British Columbia Field Sampling Manual. Water, Air and Climate Change Branch, Ministry of Water, Land and Air Protection, Victoria, BC, Canada. 312 pp.

- Data point is validated but does have reasonable variance.
- This analyte should be monitored in future RPD analysis to determine trend of variance.
- If variance of 20% to 50% persists, the lab should be notified and requested to investigate.

- RPD of >50% with results >5 times the detection limit = Fail, Category 3
 - Data point is not validated and is not suitable for quantitative use.
 - Data point should be flagged in EQulS.
 - If variance > 50% persists, the lab should be notified and requested to investigate.
 - If required, by the DQOs each analyte that fails RPD can be requested for re-analysis by the laboratory. The Data Manager will direct any re-analysis required

To confirm that field activities are conducted in a manner that meets the overall DQOs of the QA/QC program, sampling activities are conducted in accordance with the British Columbia Field Sampling Manual. Environmental personal are trained using on-site SP&Ps as detailed in the *Teck Field Sampling Manual*.

Third-party analysis of water quality was conducted by ALS Laboratory Group, Nautilus Environmental Company, and Brooks Applied Labs.

In addition to the QA/QC program that is incorporated into Teck's surface water sampling program, quality control samples and procedures specified in analytical method protocols are completed by respective analytical laboratories and include the following (as applicable to each analysis):

- Initial calibration
- Initial calibration verification
- Continuing calibration
- Calibration or instrument blanks
- Method blanks
- Laboratory control samples
- Internal standards (including certified reference material)
- Serial dilutions
- Matrix spikes
- Laboratory duplicates

The analytical laboratory determines a Method Detection Limit (MDL) for each analyte. MDLs are statistically derived and reflect the concentration at which an analyte can be detected in a clean matrix with 99 percent confidence that a false positive result has not been reported. The analytical laboratory establishes Method Reporting Limits (MRLs) at levels above the MDLs for respective parameters. These values are based on the laboratory's experience analyzing environmental samples and reflect the typical sensitivity obtained by the analytical system; they represent the level of analyte above which concentrations are accurately quantified.

The laboratory quantifies parameters at concentrations above the MRL. Parameters detected at concentrations between the MDL and MRL are flagged with a "J" qualifier to indicate that the value is an estimate (i.e., the analyte concentration is greater than or equal to the MDL and less than the

MRL). Parameters that are not detected are reported as the MDL, and are flagged with a “U” qualifier. MDLs can be adjusted by the laboratory to reflect sample dilution and/or matrix interference.

Representativeness is the degree to which data represent a characteristic of an environmental condition. In the field, representativeness is addressed by collecting samples at the permitted water sampling sites and adhering to sample collection procedures. In the laboratory, representativeness is achieved by the proper handling and storage of samples, the use of standard performance-based methods, and initiation of analyses within hold times.

Comparability is the qualitative similarity of one data set to another (i.e., the extent to which different data sets can be combined for use). Comparability is addressed through the use of field and laboratory methods that are consistent standardized procedures.

Despite the considerable level of effort and management system tools employed to achieve high quality water data, there are instances where data quality issues occurred. A summary of instances and associated issues are discussed in Section 3.3 below.

A summary of the QA/QC program associated with water quantity (i.e., flows) measurements is presented in Appendix C.

3.3 QA/QC Issues

Data quality issues encountered in 2017 were largely the result of hold time exceedances for time-sensitive water quality parameters such as nitrate-N, nitrite-N, ortho-phosphate, turbidity, and total suspended solids. A summary of data quality issues per parameter affected by hold time exceedances is listed below, with a detailed summary per water sampling site presented in Appendix D:

- Nitrate-N: 99 of 2286 data points affected (4.3%)
- Nitrite-N: 90 of 1692 data points affected (5.3%)
- Turbidity: 229 of 3411 data points affected (6.7%)
- Total suspended solids: 7 of 3423 data points affected (0.2%)
- Total dissolved solids: 6 of 1604 data points affected (0.4%)
- Ortho-phosphate: 84 of 1615 data points affected (5.2%)
- Alkalinity, total (As CaCO_3), lab measured: 15 of 1610 data points affected (0.9%)
- Conductivity, lab: 1 of 1555 data points affected (0.06%)
- Mercury: 18 of 1631 data points affected (1.1%)

In addition to the above-listed issues, the precision of laboratory results were evaluated using field duplicate samples. RDP calculations as described in Section 3.2 were performed on all duplicate samples taken. Throughout 2017 there were a total of 438 duplicate samples collected, resulting in 34,039 parameters being evaluated for RPD. Of the 34,039 parameters that were evaluated, 301 did not meet acceptable RPD assessment criteria. This represents 0.88% of the RPD analyses completed. Figure 31 below indicates the parameters that failed RPD analysis and the frequency of occurrence.

A summary of all 2017 RPD field duplicate samples is presented in Appendix D.

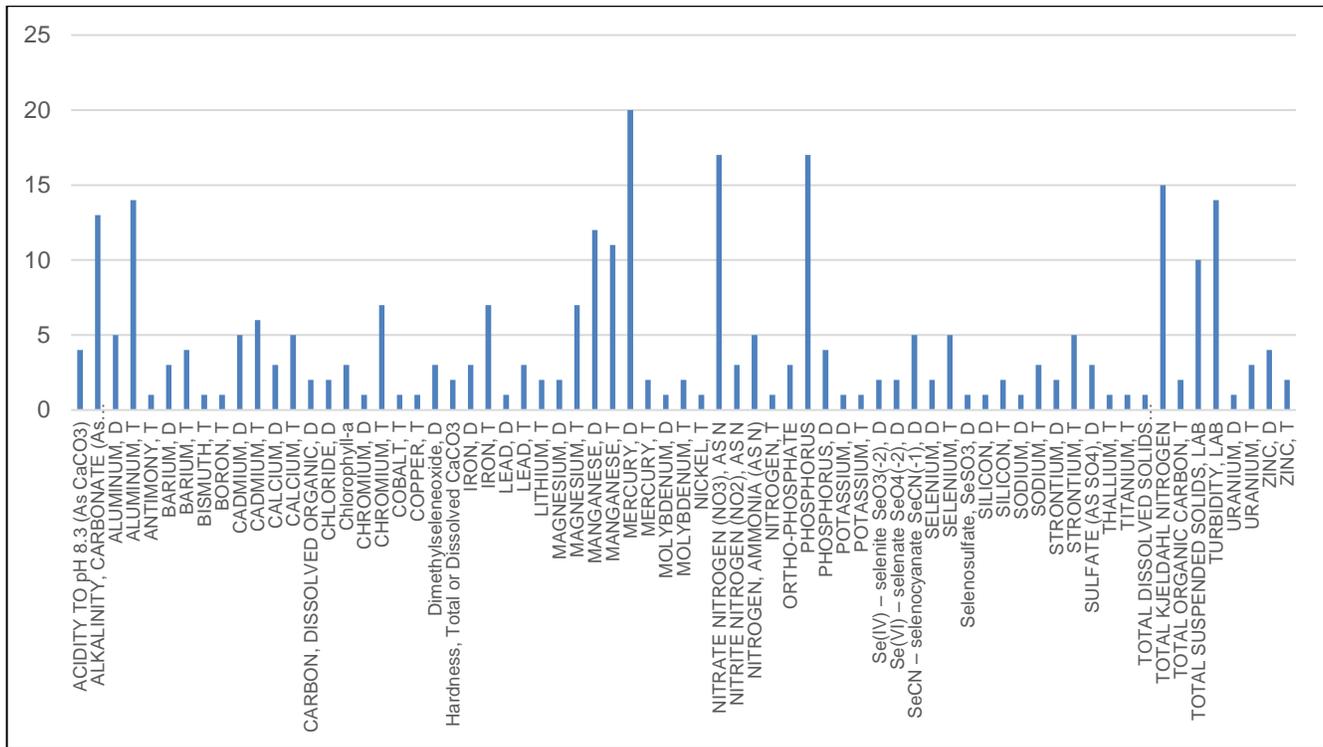

Figure 31. Summary of RPD failure by parameter.

Field blank samples were also collected in 2017 as a method to determine sample contamination during the bottle storage and sample collection, handling, and analysis process. The results of this QA/QC activity indicated several instances of potential sample contamination for multiple parameters.

Of all the parameters that had detection, there were 13 (including turbidity, total suspended solids and organic carbon) that occurred at all Teck operations associated with this permit. Results suggest that there is potential bottle contamination from sources that are common at each site and relative to the mining industry. Results also suggest that contamination is not due to sample collection or handling error by Teck staff as many different employees and contractors collect water samples across the 5 operations. In discussion with ALS Laboratories it was indicated that analytical variability can impact results of blank samples with very low detection limits as even the slightest variability (to 1/100th of a decimal place) can result in false detection. It was recommended that immediate follow up with the laboratory be conducted to confirm blank detect results and determine if they are a result of this low detection limits. Teck will implement a procedure in 2018 for review of blank results and initiate follow up with the lab to confirm results and/or determine the potential cause(s) of sample contamination such as, but not limited to, analytical variability.

A total of 27,218 parameters were analyzed for potential contamination in blank samples and of those, 888 had results above detection limits (3.2%). Of the total 888 parameters, 388 were collected from the discharge of the West Line Creek Active Water Treatment Facility. Blank detection results in samples collected from the treatment plant are discussed in Section 5.4.

The remaining blank detect results were from samples collected at discharge and receiving environment locations at the operations. Figure 32 and Table 15 below summarize the blank detect results by parameter and by operation respectively. Tracking this data by location and parameter will allow Teck to determine if the blank detection is consistent across all operations or if it is a specific issue is related to one area or a deviation from standard sampling and analysis practices. It will also allow for improvements to be monitored once new procedures and practices are implemented.

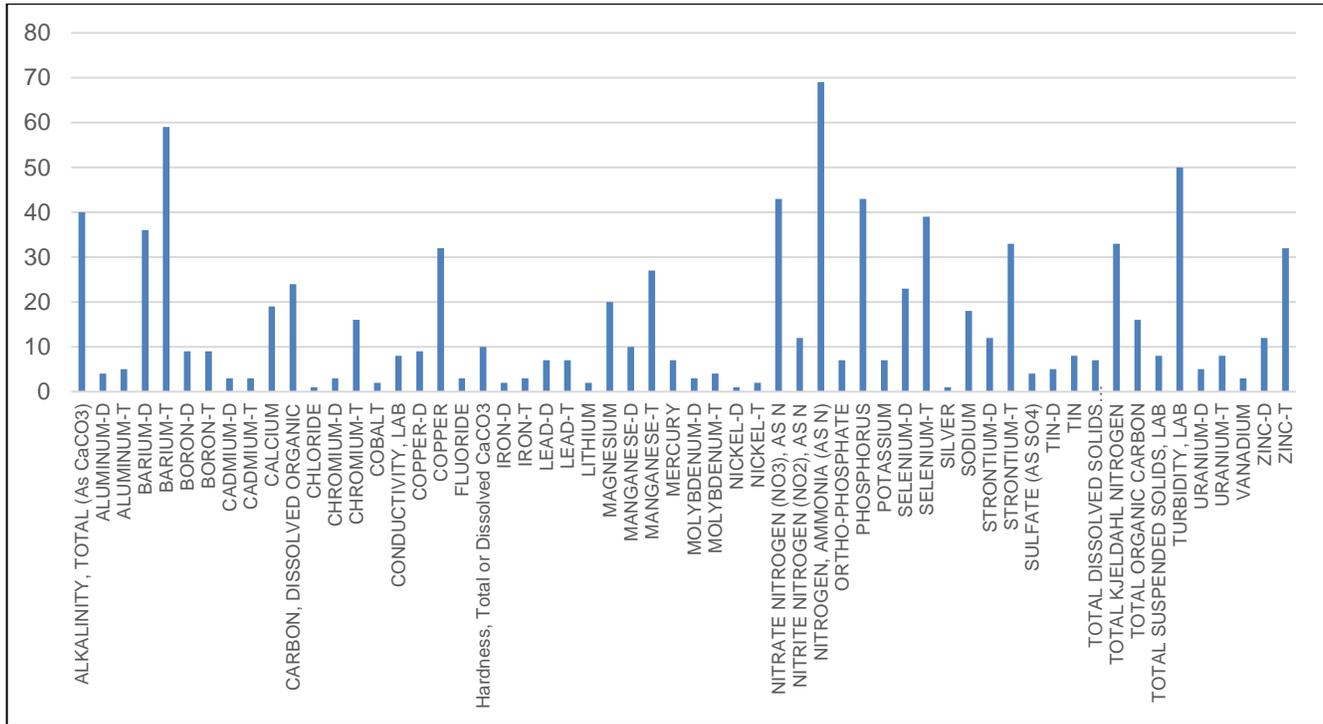

Figure 32. Summary of blank sample detect results by parameter.

Table 15. Blank detect samples by operation.

Operation	Blank Samples Collected	Number of Detect Results	% Of Total by Operation
Fording River	2,263	57	2.5%
Greenhills	4,478	65	1.5%
Line Creek	6,568	188	2.9%
Elkview	5,781	78	1.3%
Coal Mountain	1,406	52	3.7%
Regional	3,153	60	1.9%
West Line Creek Active Water Treatment	4,069	388	9.5%
Totals	27,718	888	3.2%

There were 5 samples in 2017 when the method detection limits for sulfide was elevated above the BCWQG at receiving environment monitoring LC_LC3 – EMS #0200337. This occurred due to a

temporary constraint at the primary lab in which the sulfide analysis was sent to an alternate ALS lab for completion. This secondary lab did not have the equipment with sufficient precision to complete the analysis with the required detection limit. Teck has since communicated with the laboratory the need for all analysis to be completed at the lowest possible detection that will allow for comparison to appropriate BCWQGs.

There were an additional 9 samples in 2017 when mercury detection limits were elevated above the BCWQG. Teck continues to implement procedures for ultra-trace mercury analysis with a method detection limit of 0.00050 µg/L in place of the standard mercury analysis.

In addition to the above QA/QC issues, there were several instances when issues with calibration and/or function of field equipment occurred. A summary of issues with field equipment is provided below in table 16.

Table 16. Summary of field equipment issues recorded in 2017.

Date	EMS ID	Location Code	Issue	Reason
2/16/2017	E302170	EV_AQ6	pH, Field	Suspected faulty pH probe as corresponding lab pH results were significantly different. The field probe calibrated correctly in Teck's lab and recorded the same results as a different calibrated YSI but field results were variable.

6/21/2017	E258937	CM_MC2	Dissolved oxygen	Dissolved oxygen was collected at the time however the measurement was incorrect (113.7 mg/L).

3.4 Toxicity Testing Program

Toxicity testing is carried out at a number of sampling sites on a quarterly basis. Biological test methods routinely employed include:

- Acute lethality test using Rainbow Trout; universal method: EPS 1/RM/9
- Acute lethality test using *Daphnia* spp.; universal method: EPS 1/RM/11
- Toxicity Tests using early life stages of salmonid fish (Rainbow Trout); universal method EPS 1/RM/28-1E)
- Growth inhibition test using a freshwater alga; report EPS 1/RM/25
- Test of reproduction and survival using the cladoceran *Ceriodaphnia dubia*; report EPS 1/RM21

- Fathead Minnow, *Pimephales promelas*, larval survival and growth test; U.S. Environmental Protection Agency (EPA) Method 1000.0

In addition to the above-listed standard methods, a modified 28-day water-only test with the amphipod, *Hyalella azteca* is also completed. This test is not a standard test but rather has been modified from “Methods for measuring the toxicity and bioaccumulation of sediment-associated contaminants with freshwater invertebrates (second edition)”, EPA/600/R-99/064.

Section 10.3 of Permit 107517 requires that Teck report annually on the Chronic Toxicity program. This report is submitted to the Director under separate cover by April 30th of each year following the data collection calendar year. Chronic toxicity tests were completed in 2017 in accordance with Section 9.8 of Permit 107517.

Acute toxicity tests and associated QA/QC measures are completed in accordance with the above-listed methods by the testing laboratory and are detailed in testing reports. A summary of all test results and reports are included in Appendix G and H respectively.

4 Spills and Incidents

There were a total of 221 reportable spills recorded at Teck’s operations in the Elk Valley in 2017. Table 17 below shows a summary of spills by operation. The most common substance spilled was fuels/lubricants.

Over the past 5 years, Teck operations has implemented a Hydrocarbon Management Program in an attempt to improve equipment reliability by reducing the quantity and frequency of hydrocarbon leaks. The program has three main objectives, Accurately Measure Hydrocarbons to our Assets, Take Action quickly on assets that consume abnormal quantities of hydrocarbons, and improve our Maintenance Strategies to prevent leaks from occurring. Each site has installed hydrocarbon metering devices on mobile assets. The meters enable our sites to collect hydrocarbon dispensing data which is analyzed in real time by a specialized computer program. This software automatically flags any abnormal or unexpected dispensing events and sends the event information to the shop supervisor so action can be taken. Lastly, each site has reliability engineers focusing on developing hydrocarbon hose exchange programs for the assets and improving overall hydrocarbon practices on site. As a result of this program, the coal business unit has reduced the quantity of hydrocarbons used at our sites significantly. Due to the success of the program, it is now being implemented in other business units including Copper and Zinc.

Appendix J contains a detailed list of all spills that occurred in 2017 including a reference to the Emergency Management British Columbia (EMBC) report number. All spills were responded to as per Teck’s spill response procedures. For more information on the remedial actions associated with spills refer to the reported information associated with the incident numbers referenced in Appendix J and to the annual effluent reports from each operation, submitted under separate cover.

5 Monitoring Results

Water sampling results are used for a wide range of analyses. This includes, for example, to evaluate compliance (refer to Section 2), for research and development, effects assessments, baseline data collection, geochemical source term derivation, to evaluate key receiving environment sampling sites in relation to SPOs and/or applicable approved/working water quality guidelines. The following section summarizes receiving environment monitoring results in relation to British Columbia approved/working water quality guidelines (BCWQG). In addition and as outlined in Section 10.2.4 of Permit 107517, the following section evaluates trends for Order-defined constituents of interest (selenium, nitrate-N, sulphate, and dissolved cadmium) at significant source sites (i.e., dormant and active waste rock dumps), and key receiving environment sites (Order stations). Because selenium, nitrate-N, sulphate, and cadmium have permitted limits (refer to Section 2), they are not compared to the BCWQGs. A summary of surface water quantity monitoring results is provided in Appendix C.

5.1 Surface Water Quality – Receiving Environment

In 2017 a total of 43,697 analyses were conducted from receiving environment water samples as required under Permit 107517 and compared to BC WQGs (excluding parameters with specified limits or SPOs as identified in the EVWQP, i.e., selenium, nitrate-N, sulphate, and dissolved cadmium). Of those, 690 (1.6 percent) were identified as having concentrations above a BC WQG at a site designated as a receiving environment monitoring location in Permit 107517. The presentation of data and interpretation below excludes Order constituents as these were previously discussed in Section 2 for selenium, nitrate-N, sulphate, and dissolved cadmium. Figure 33 shows a summary of these instances compared to total samples taken by parameter for total cobalt, nitrite, dissolved aluminum, total uranium, total mercury, and total iron. These parameters are also discussed in further detail below.

There were other instances where beryllium (20x), silver (1x), zinc (4x), copper (4x), and arsenic (1x) were also elevated above BCWQGs; however, with the exception of beryllium, there were very few occurrences and results are just slightly over the BCWQG. Because of the low frequency and proximity of results to the BCWQG, these are not further discussed in this report. Beryllium was above the BCWQG in 20 samples but each result was marginally over the guideline of 0.13 µg/L with an average result of 0.16 µg/L. These parameters will continue to be monitored should an increasing trend become apparent. A graphical representation of beryllium results compared to the BCWQG is shown in Figure 41.

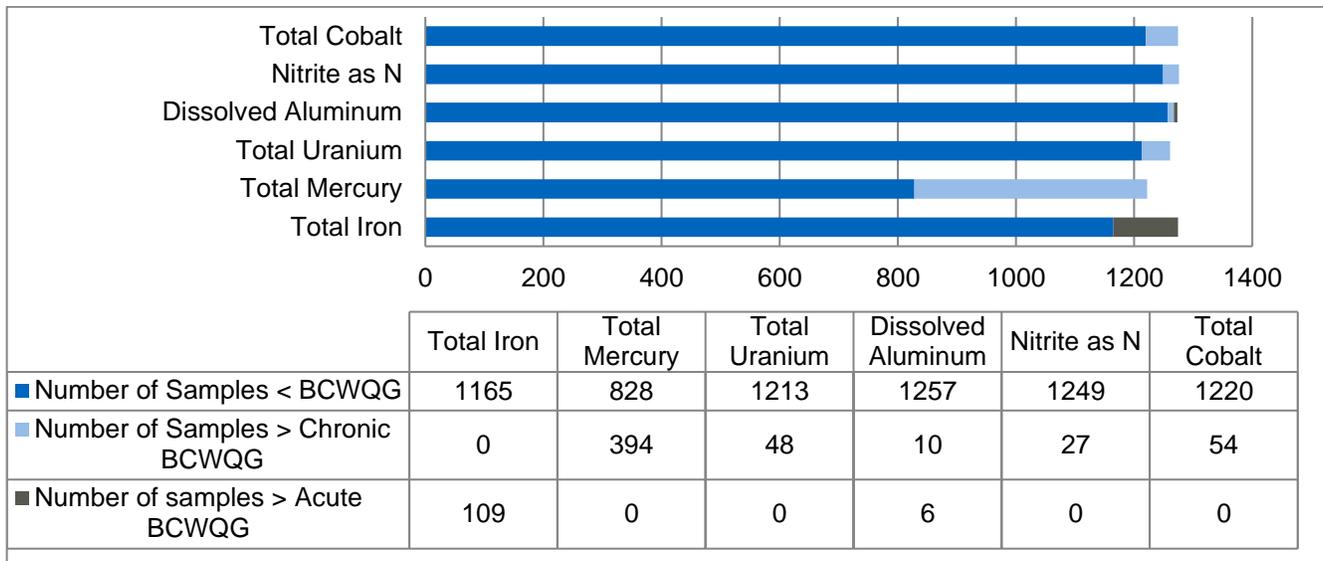

Figure 33. Summary of the majority of instances of concentrations measured above BC WQG at receiving environment monitoring locations compared to total number of samples taken by parameter.

A summary of the majority of parameters and associated sampling locations in which a detected analytical concentration was measured above a BC WQG is presented in Table 18, with a complete detailed list of all parameters, excluding Order defined parameters, presented in Appendix F.

Table 18. Summary of receiving environment water sampling sites where concentrations were measured above a British Columbia Approved or Working Water Quality Guideline in 2017.

5.1.1 Mercury Results Above BC WQGs

The majority of instances where concentrations were measured above BC WQGs in 2017 were for total mercury. The BC WQG for mercury is based on the percent of methyl mercury present, in which the lower the percentage of methyl mercury, the higher the BC WQG. For the purposes of revising Teck's monitoring protocol for mercury sampling and interpretation of mercury results, Teck is sampling for methyl mercury in order to quantify the methyl mercury percentage of total mercury and therefore be in a better position to identify if this is a result of mining operations and/or if there are any associated risks to the receiving environment. In 2017, 217 samples were collected from receiving and discharge streams with only 27 of those results above detection for methyl mercury. All calculations completed indicate that the methyl mercury percentage of total mercury is between 0.77 and 7.95 %.

Concurrent methyl mercury samples were not available with all of the mercury samples. These samples, as shown in Figure 33, were compared to the most conservative guideline of 0.00125 µ/L (red line on Figure 33) which assumes > 8% methyl mercury.

In 2017, methyl mercury was represented less than 8% of total mercury for all samples, indicating that a BC WQG of 0.01 µ/L is more appropriate for comparison. If this guideline was applied to all samples as it was to those with corresponding methyl mercury results in 2017, there would be 13 exceedances rather than 394. Teck continues to collect additional methyl mercury data to help identify the applicable guideline for future comparisons and revise sampling procedures. Figure 34 below shows the 2017 ultra-trace mercury data and demonstrates the three guidelines calculated based on the percent methyl mercury. The green triangles represent methyl mercury samples that were collected in conjunction with total mercury and their percentage of the total mercury. It should be noted that for this purpose, the data in the figure are grab samples and not monthly averages.

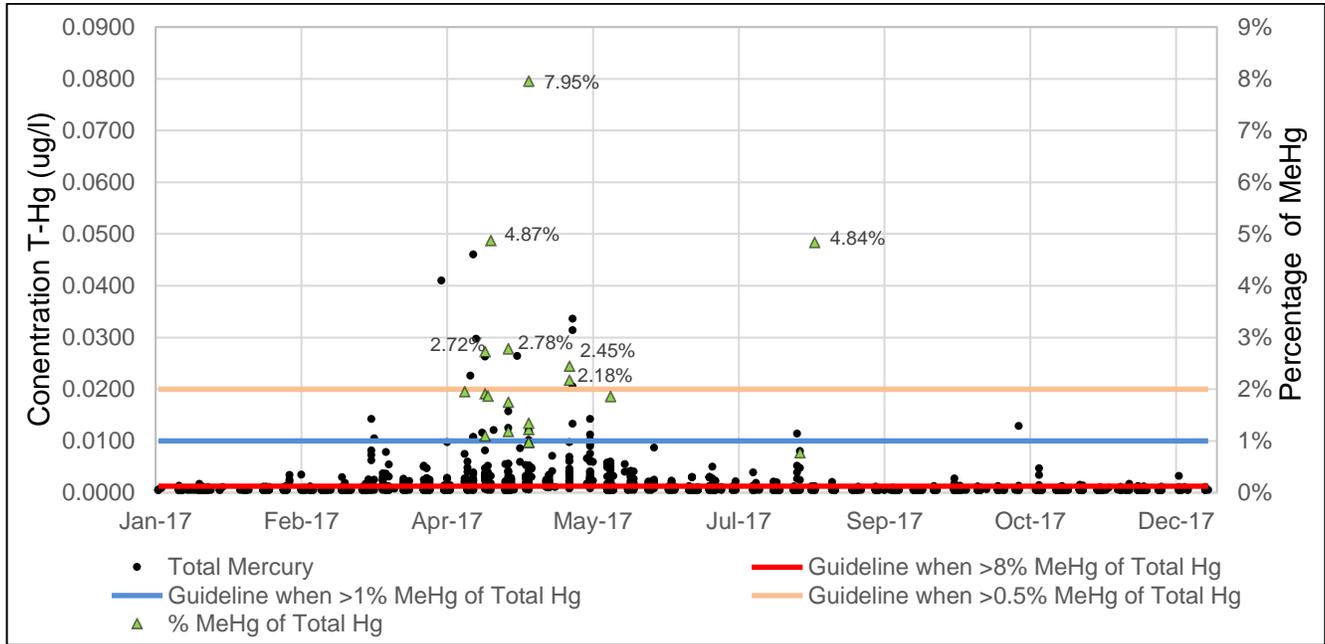

Figure 34. Methyl mercury percentage of total mercury and applicable guidelines.

5.1.2 Uranium Results Above BC WQGs

Total uranium concentrations were measured above the working BC WQG (8.5 µg/L) in 2017. Of the 45 observed concentrations above the Canadian Council of Ministers of the Environment (CCME) long term guideline for uranium (15 µg/L) in the receiving environment, 43 (96%) were recorded at E261958 (LC_WLC) with the remaining 2 (4%) recorded at E309911 (GH_GH2).

For additional context and comparative purposes, total uranium concentrations are also compared to the short- and long-term CCME guidelines (Figure 35). However, it should be noted that, the CCME guideline was developed using the species sensitivity distribution (SSD) method which has not been adopted by BC and therefore the lower fiducial limit of the SSD 5th percentile is adopted as the BC WQG (working guideline).

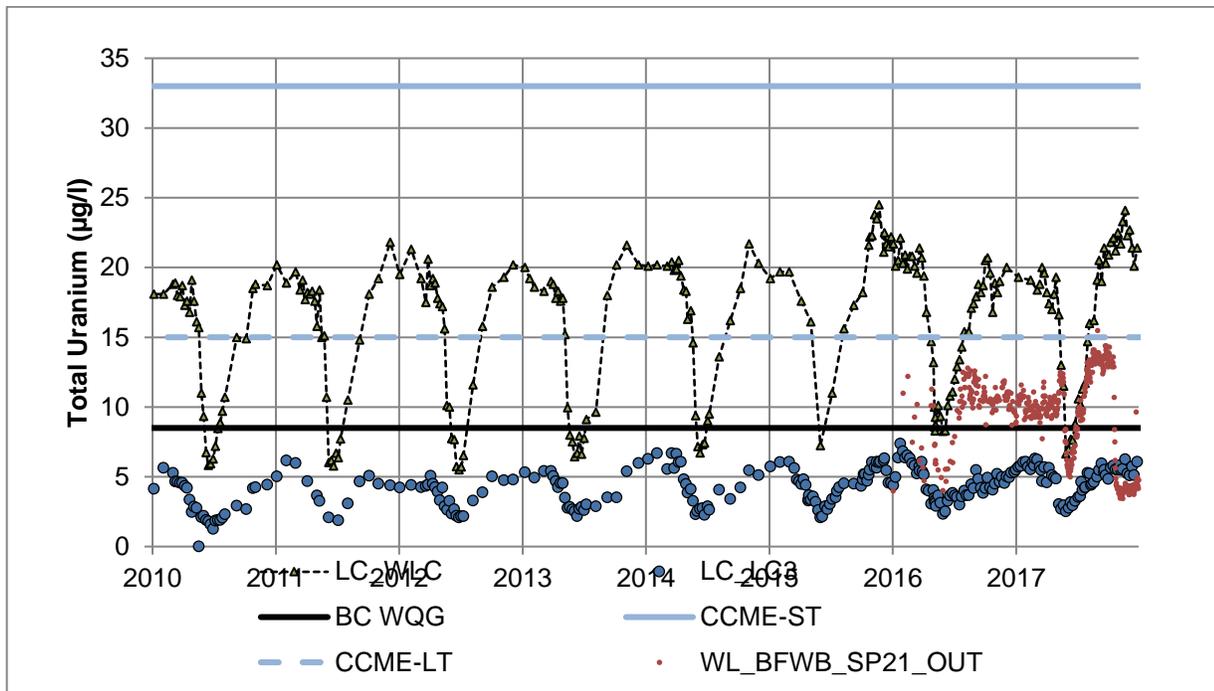

Figure 35. Total uranium concentrations recorded at water sampling site E261958 (LC_WLC).

Note: Total uranium concentrations are plotted in relation to the CCME short-term (33 ug/L; solid grey line CCME-ST) and long-term (15 ug/L; dashed grey line CCME-LT), and the BC WQG working guideline (8.5 ug/L; solid black line).

As illustrated within Figure 35, uranium concentrations recorded at E261958 (LC_WLC) are routinely above the BC WQG, and during low-flow periods, the CCME long-term water quality guideline while always remaining below the CCME short-term water quality guideline. Despite the fact that uranium concentrations at E261958 (LC_WLC), which is non fish bearing, are elevated relative to water quality guidelines, concentrations at hydrologically down-gradient receiving environment sampling sites (i.e., 0200337 (LC_LC3)) remain below BC WQG. Additional monitoring and evaluation of biota downstream of this area is detailed in the Line Creek Local Aquatic Effects Monitoring Program submitted under separate cover.

It should also be noted that although LC_WLC is considered a receiving environment location in the permit, during the months of August to May (flow dependant) 100% of West Line Creek (WLC) is treated in the WLC Active Water Treatment Facility (AWTF) and discharged to the receiving environment via WL_BFWB_OUT_SP21. During the remaining months of the year, June and July, flows are at peak levels and uranium concentrations are below the BC WQG of 0.085 mg/l. The red dots in Figure 35 indicate uranium concentrations entering the receiving environment from the AWTF are all below the CCME long-term water quality guideline and are more indicative of the uranium concentrations from LC_WLC.

The potential effects of uranium concentrations and other water quality constituents on aquatic life in the Fording River will be evaluated in the Regional Aquatic Effects Monitoring Program (RAEMP) and the Fording River Local Aquatic Effects Monitoring Program. Teck also has an ongoing chronic toxicity

program in the Fording River which will provide an indication of potential effects of water quality constituents on aquatic life.

5.1.3 Iron Results Above BC WQGs

Concentrations of total iron above the BC WQG were also observed in 2017; the majority of total iron exceedances occurred at four locations on the Elk River, two on Michel Creek and at most of the regional sampling locations downstream of all mining operations. Concentrations of total iron above the BC WQG (1 mg/L) primarily occurred in the spring. These elevated levels coincide with increased turbidity both upstream and downstream of Teck mines indicating that the measured iron concentrations were from iron in suspended solids. Similar to mercury samples, elevated total iron at regional sampling locations downstream of mining operations coincided with elevated concentrations upstream of mining operations (points identified with triangles). Figure 36 shows total iron concentrations in the Elk River, Michel Creek, and at regional locations downstream of mining operations. There were no observations of exceedances of the total iron guideline in the Fording River.

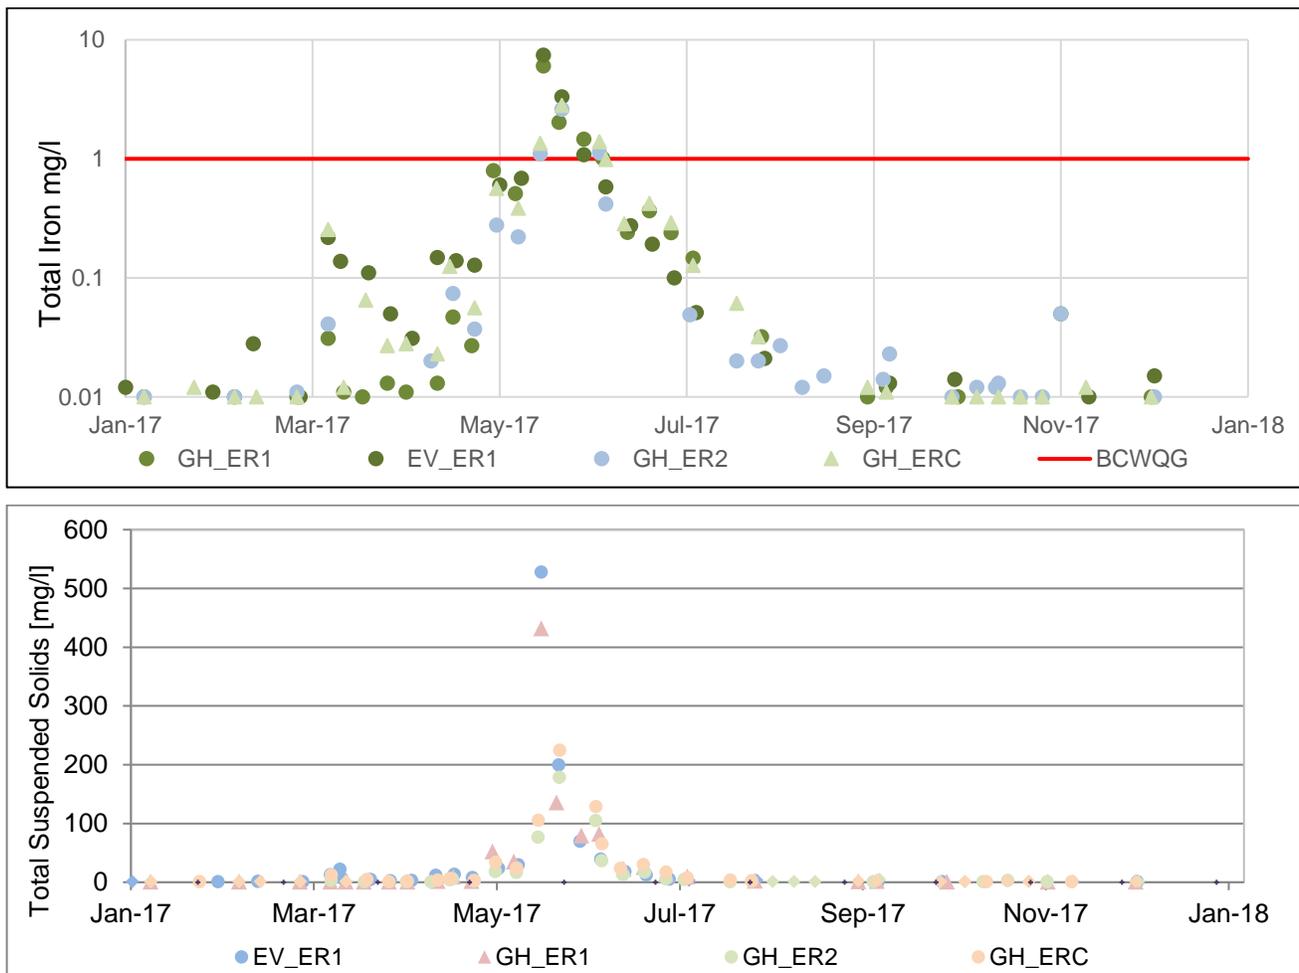

Figure 36. Iron concentrations and corresponding TSS concentrations in the Elk River. Triangle markers represent monitoring locations upstream of mining activities.

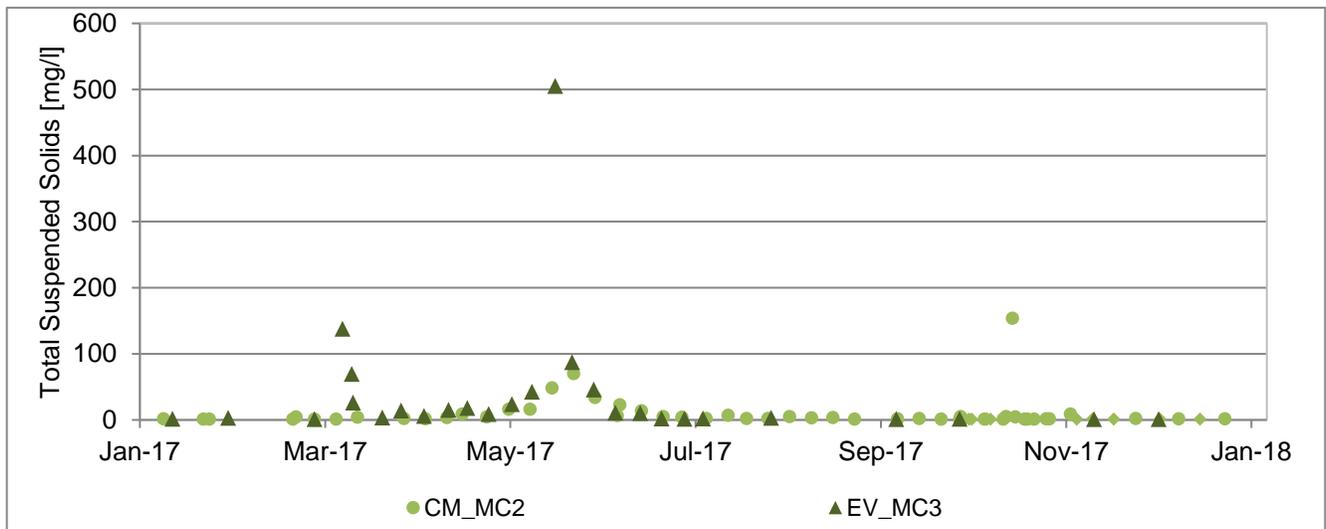

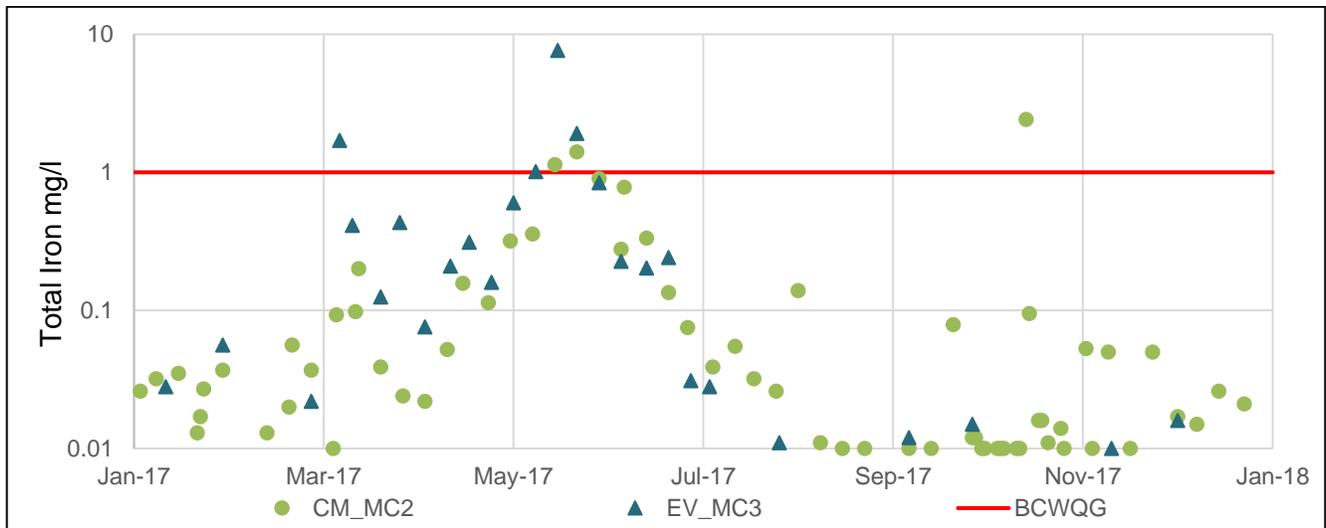

Figure 37. Iron concentrations and corresponding TSS concentrations in the Michel. Triangle markers represent monitoring locations upstream of mining activities.

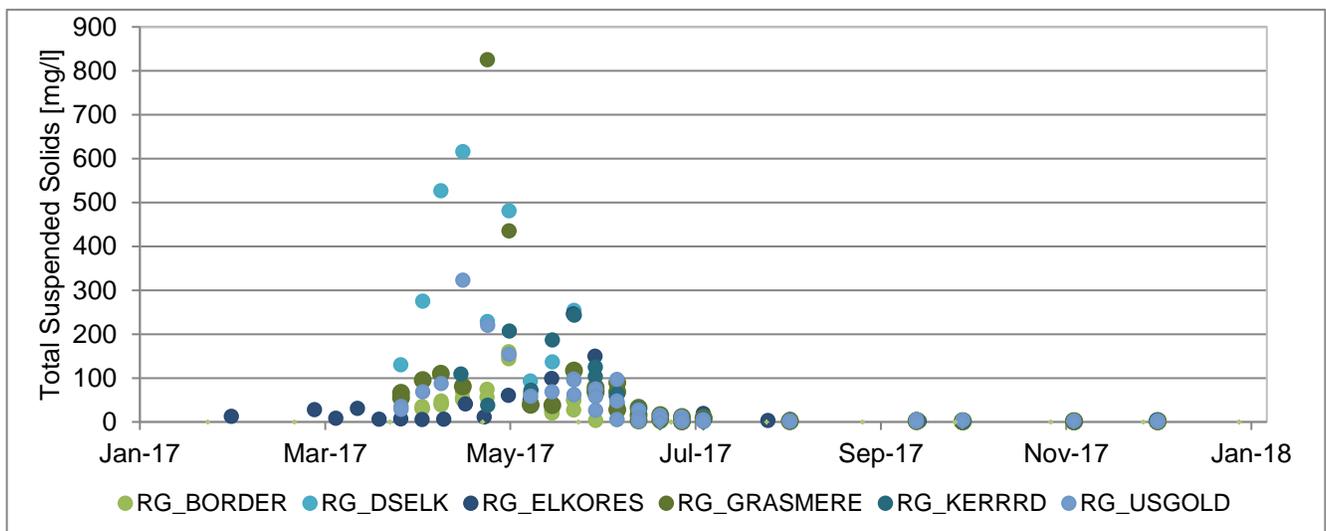

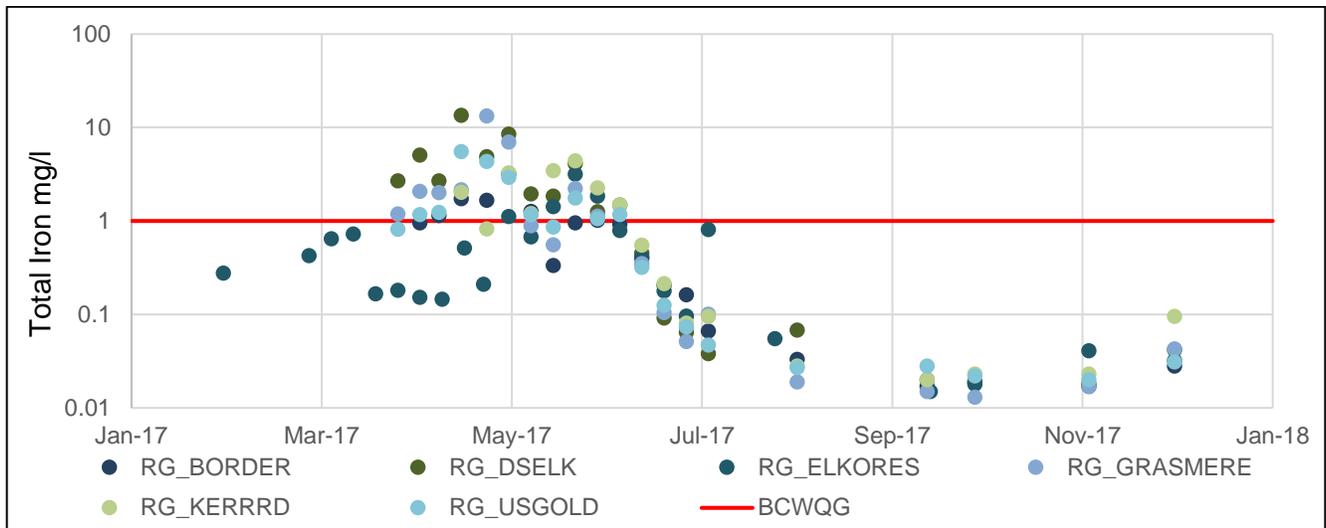

Figure 38. Iron concentrations and corresponding TSS concentrations in Regional Samples. Triangle markers represent monitoring locations upstream of mining activities.

5.1.4 Cobalt Results Above BC WQGs

Elevated cobalt levels were observed downstream of Coal Mountain Operation (CMO) at Compliance Point E258937 (CM_MC2). As shown in Figure 37, cobalt concentrations were occasionally above the 30 day average BC WQG of 4 ug/L at the Compliance Point but were never above the maximum BC WQG of 110 ug/L. The main sources of cobalt at CMO are the 14 Pit horizontal drain discharge and 34 Pit dewatering. These sources discharge to the main sedimentation ponds system (CM_SPD) which decants to Corbin Creek 0200209 (CM_CC1). Although not required by Permit 107517, CMO has implemented a pit dewatering monitoring plan under the local effluent permit and data collected from this plan is submitted to the ENV in quarterly reports.

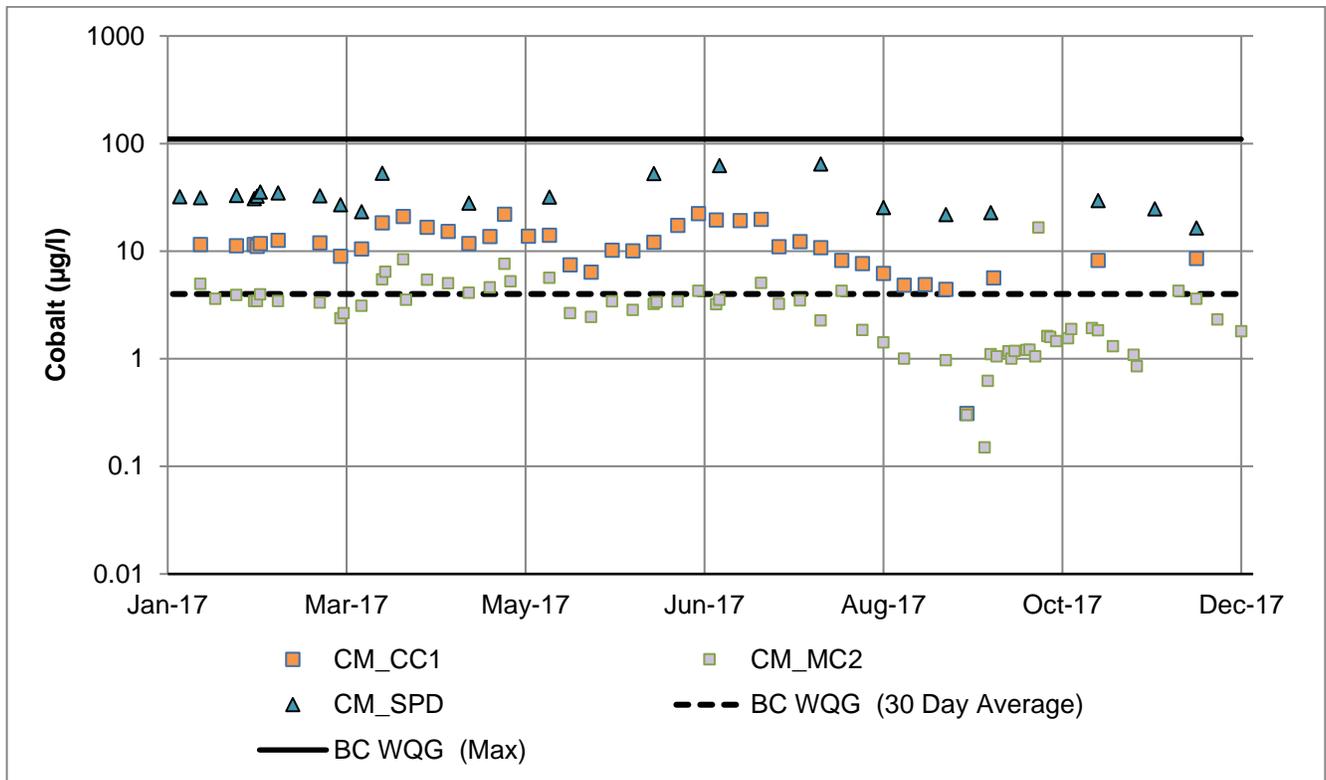

Figure 39. Cobalt concentrations at discharge E102488 (CM_SPD) and receiving stations 0200209 (CM_CC1), E25937 (CM_MC2) at Coal Mountain Operation. (Note the log scale on the y-axis).

5.1.5 Nitrite Results Above BC WQGs

Elevated nitrite concentrations were also observed downstream of CMO in 2017 (Figure 38). There was apparent changes to the range of nitrite concentrations observed in 2017 compared to concentrations measured in 2016. Concentrations at CMO’s Compliance Point were occasionally above the 30 day average BC WQG during periods of low flow but did not exceed the maximum BC WQG. The main sources of nitrite are pit dewatering activities which are captured in water quality samples collected at CM_SPD as shown below in Figure 38.

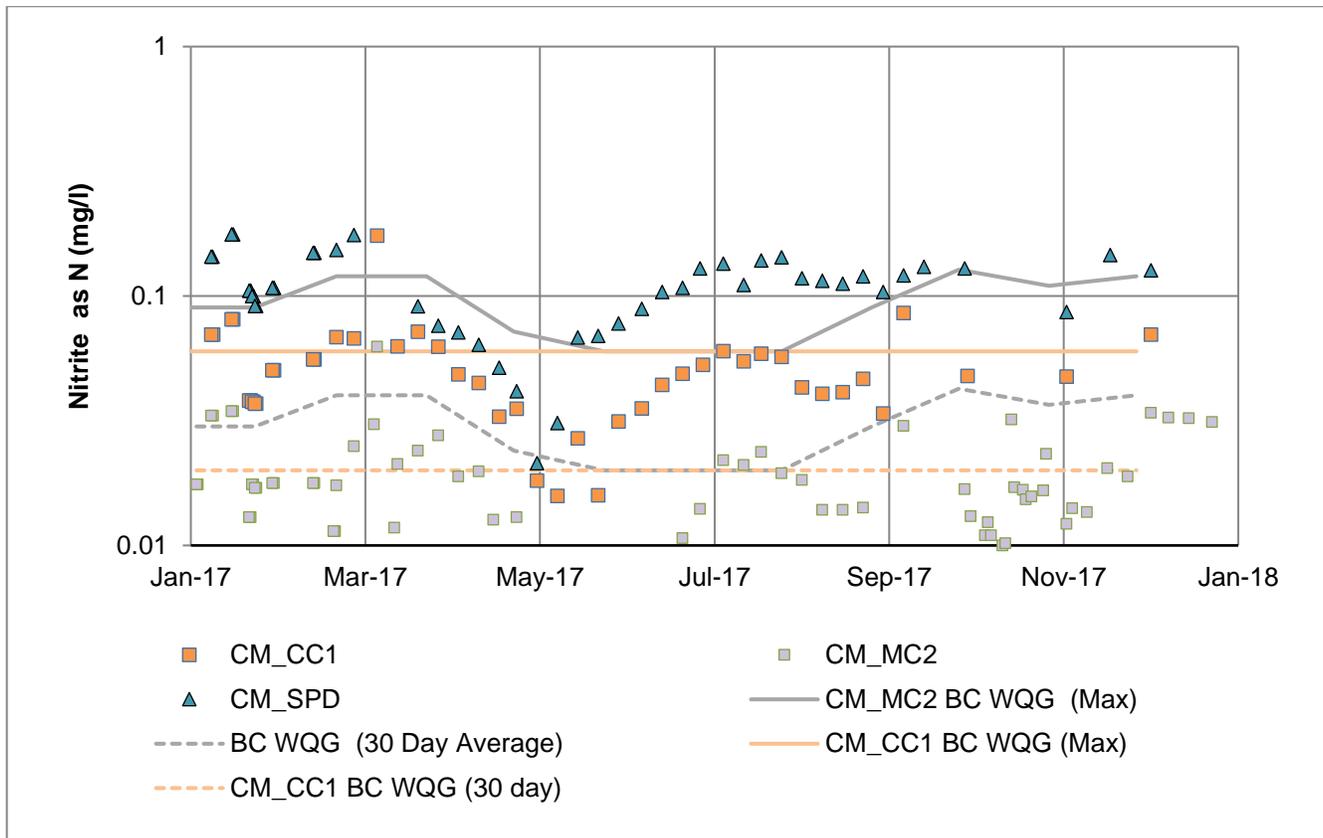

Figure 40. Nitrite concentrations at discharge E102488 (CM_SPD) and receiving stations 0200209 (CM_CC1), E25937 (CM_MC2) at Coal Mountain Operation.

Note: The BC WQG for nitrite is chloride dependent. The guidelines plotted above reflect chloride concentrations at CM_CC1 and CM_MC2. Nitrite concentrations are on a logarithmic scale.

Teck has developed a Care and Maintenance (C&M) Integrated Water Management Plan (IWMP) for CMO which was submitted to EMPR in December of 2017. The overarching water management goals at CMO are to identify and manage water related risks, maintain compliance with permit limits, and continually improve water quality by reducing sediment and mine-related constituent loads. These goals remain unchanged for the C&M period. Measures to achieve these goals include incorporating water management into mine and closure planning, identifying upgrades to current drainage systems, and implementing measures proven through research and development, monitoring, evaluating and adjusting existing programs. The purpose of the C&M IWMP is to describe how water will be

managed to meet CMO’s objectives and performance criteria, provide direction and strategy to address water management risks and challenges, and to establish how water management infrastructure performance will be monitored and reviewed.

5.1.6 Beryllium Results Above BC WQGs

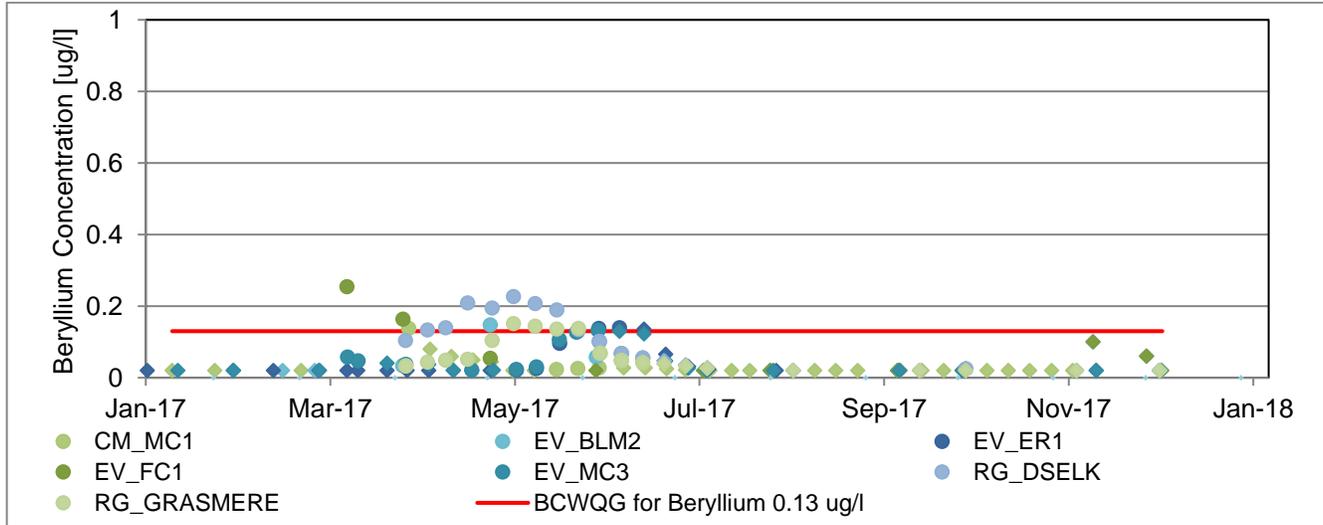

Figure 41. Beryllium results above BCWQGs in 2017.

5.1.7 Field Parameters Results Above BC WQGs

In addition to the parameters mentioned above, there were 97 recorded data points for individual field parameters above BC WQGs (i.e., pH, temperature, and dissolved oxygen). A summary of field parameters and associated sampling locations in which a concentration was identified as being above a BC WQG is presented in Table 19, with a detailed list presented in Appendix E.

Table 19. Summary of field measurements that exceeded BC FAL WQG in 2017.

		Temperature, Field	2

With the exception of temperature, field measurements rely on equipment calibration. As noted in Section 3.3, there were calibration issues associated with field measurements and as such, pH measurements identified as being outside the guideline range should be considered with that context. Similarly, although instantaneous measurements of dissolved oxygen were recorded to be less than the long-term BC WQG (8.0 mg/L), they were consistently above the instantaneous minimum BC WQG value of 5.0 mg/L.

BC WQG's for temperature were exceeded the most in 2017 of all field parameters, (67 of 97) due to extremely high summer temperatures and very limited precipitation resulting in low flow and increased warming of water retained in settling ponds. Of the 67 exceedances, 61 occurred in the Kooconusa Reservoir, which has higher than normal temperatures due to the nature of reservoirs that retain water to allow for extended periods of warming.

5.2 Three Year Trend Analysis of SPOs at Order Stations

The following section provides an overview of the three year trend in monitoring data collected at Order Stations in relation to SPOs since the implementation of Permit 107517 in 2015, as required in Section 3.2.2. of Permit 107517 which states that:

After 3 years of data collection the Permittee must undertake trend analysis at each of the site performance objective locations and submit the trend analysis with the next annual report. The first annual report is due in 2018. The Permittee must use the trend analysis to predict expected concentrations for the next 3 year period. If after consideration of planned mitigation measure any of the site performance objective locations are expected to exceed the maximum concentrations listed in Section 3.1, the Permittee must:

- 1) Immediately notify the Director of the potential future exceedance;
- 2) Reassess discharge sources and determine appropriate limits for the compliance points detailed in Section 2, or new compliance points based on reassessment of discharge sources; and

3) Provide to the Director an application for an amendment of this permit with new or revised Section 2 limits within 3 months.

Linear trends in selenium, nitrate, sulphate, and cadmium were projected for each Order Stations for the next three-year period (2018 to 2020) using at least three years of the most recent historic data, extended back to 2010 where possible (some locations have a data record that does not extend back to 2010). For these locations, all available data was used. Monthly averages were used in the trend analysis at each Order Station to account for increased monitoring during freshet, which can overweight this time period of high flows and lower concentrations. This also coincides with how water quality results are compared to SPOs, which are monthly averages for each constituent at each Order Station. Figures 39 through 66 presented below reflect the trends of SPOs at Order Stations.

The purpose of the analysis was to evaluate whether SPOs may be expected to exceed the maximum concentrations listed in Section 3.1 of the Permit. The projected trends are one line of evidence, but do not account for future mining or water management activity. To provide that context, the projected results of the three year linear trends analyses were compared to the projections from the 2017 Elk Valley Regional Water Quality Model (RWQM). The 2017 RWQM was used to assess how concentrations of nitrate, selenium, sulphate and other constituents may change over time with continuing mine development and implementation of planned water quality mitigation. The initial implementation plan, as incorporated in the 2017 RWQM, reflects the EVWQP and Permit 107517 with some adjustments:

- Changes to the forecasted operational date for the Fording River South Active Water Treatment Facility (AWTF) and the Elkview Operations Phase 1 AWTF to reflect their current schedule status and;
- Modelled start dates for remaining treatment facilities shifted from the operational dates in the permit (i.e. the date at which the facility is seeded with biology), to reflect the subsequent commissioning and ramp-up time (up to 12 months) for a facility to reach fully effective operating capacity. Teck is in the process of adjusting the implementation plan in consultation with regulators and the KNC. The objective of the adjustment will be to maintain a plan that will meet long term SPOs at Order Stations.

The water quality projections generated in the 2017 RWQM take into account the a range of flow conditions, the current understanding of constituent release from waste rock spoils, planned water management and mitigation and mine plans. The three year trend analysis method does not consider the complexities captured in the RWQM, nor the implementation of water treatment.

Interpretation of the three year linear trends analyses considered the following:

- Results of the 2017 RWQM
- Existing and future planned mitigation (e.g., AWTF)
- Operational activities that occurred in 2017 that may have affected water quality but are not anticipated to occur in 2018 to 2020 (e.g., changes to pit dewatering activities)

Based on the trend analysis, sulphate and cadmium SPOs are expected to be met at all Order Stations over the next three-year period. The results of the three year trends analysis are consistent

with the RWQM, which also projected sulphate and cadmium concentrations below SPOs for the next three-year period.

Although nitrate concentrations represented by the linear trend projected for 2018 – 2020 are below the SPOs, visual inspection of historical data indicates that nitrate concentrations may seasonally exceed SPOs for some sites. The 2017 RWQM projections are seasonally above the nitrate SPOs at the Order Stations GH_FR1, EV_ER4, and EV_ER1 in the near term (before the FRO South AWTF is fully effective). The projected concentrations above the SPOs occur during with winter low flow conditions. Visual inspection of historical variability and projected linear trend indicate that nitrate concentrations may be above the SPOs on a seasonal basis for GH_FR1, EV_ER4, and EV_ER1, which is consistent with the results of the 2017 RWQM. For all other Order stations, both the linear trend and 2017 RWQM projections indicate nitrate concentrations are expected to be below SPOs.

Selenium concentrations represented by the linear trend projected for 2018-2020 are below the SPOs, but similar to nitrate, visual inspection of the historical data indicates that concentrations may seasonally exceed the SPOs for some sites. The RWQM also indicates that in the near-term (before the FRO South AWTF is fully effective by the end of 2021) selenium concentrations are projected to approach or exceed the SPOs at GH_FR1, LC_LC5, EV_ER4, and RG_DSELK. Visual inspection of historical variability and the projected linear trend indicate that selenium concentrations may be above the SPO on a seasonal basis for GH_FR1, LC_LC5, EV_ER4, and RG_DSELK, which agrees with the results of the 2017 RWQM. Based on the trends analysis and historical variability in the data, maximum selenium concentrations may approach but not exceed the SPO at EV_ER1 within the next three years, although there greater uncertainty in the trends analysis results compared to the RWQM predictions.

Moving forwards Teck will continue to utilize the implementation of the EVWQP and updates to the RWQM to interpret the results of the three year trends analysis and evaluate compliance with SPOs at Order-defined monitoring locations. Greater weight will placed on the water quality predictions developed using the RWQM as this model can account for planned mitigation.

Through recent discussion on both delays in water treatment and the Regional Water Quality Model updated projections, ENV was notified of potential exceedances of SPOs in the near term. At this time, no application for an amendment of this permit for revised limits/SPOs has been submitted as Teck continues to work through the Implementation Plan Adjustment with regulators and KNC.

5.2.1 Selenium Trends

The following graphs represent linear trends of total selenium at Order Stations from 2010 to 2020 where data is available.

5.3 Source Discharges of Order-Defined Constituents of Interest

Permit 107517 takes an area based approach to authorizing and managing water quality constituents of interest, specifically selenium, nitrate, sulphate, and cadmium (i.e., the Order-constituents). The following section discusses the four Order-constituents in relation to key receiving environment sampling sites (i.e., Order Stations) and discharge locations (i.e., waste rock dumps). Unlike Section 2.2, the following section does not evaluate compliance. Similarly, given that Order-constituents are evaluated relative to SPOs, the focus is not if BC WQGs are exceeded. Rather, the focus is on temporal patterns observed in concentrations of Order-constituents and how upstream discharge sites may affect downstream water quality. As part of this evaluation, a distinction is made relative to waste rock dump status (i.e., active versus dormant) and the conceptual model for water flow through waste rock and constituent release/transport are discussed following the presentation of the data. For purposes herein, a dormant waste rock dump is defined as not having any new waste deposited for a period of ≥ 1 year; while an active waste rock dump is defined as receiving or having received waste rock within the past year (i.e., < 1 year).

5.3.1 Selenium

Total selenium concentrations within the Valley have been increasing since the 1990's and based on data collected by Environment Canada and its partners at long-term water quality monitoring station BC08NK0003 in the Elk River (at Highway 93 bridge South of Elko, BC), concentrations have been above the BC WQG (2 $\mu\text{g/L}$) since approximately 1993 (Figure 45). Selenium concentrations at BC08NK0003 have steadily increased over time, reaching a peak concentration (11.2 $\mu\text{g/L}$) in November of 2017. Similar temporal patterns can be seen at upstream Order Stations (Figures 68-70).

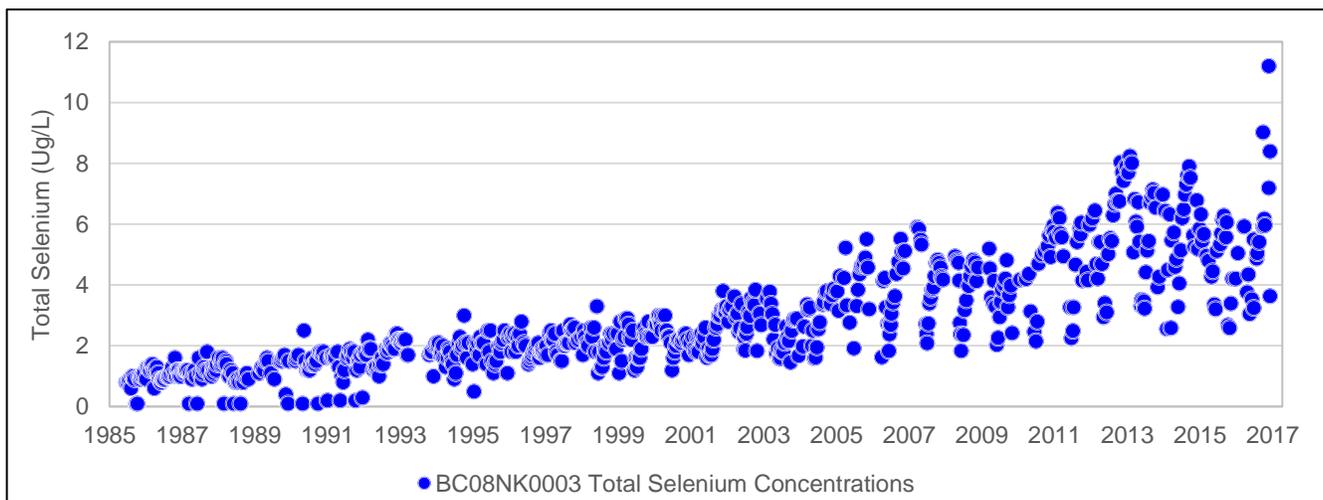

Figure 70. Total selenium concentrations recorded at water quality surveillance monitoring station BC08NK0003 in the Elk River.

Note: Data were accessed from <http://www.ec.gc.ca/eaudouce-freshwater/default.asp?lang=En&n=EFDA57C6-1>

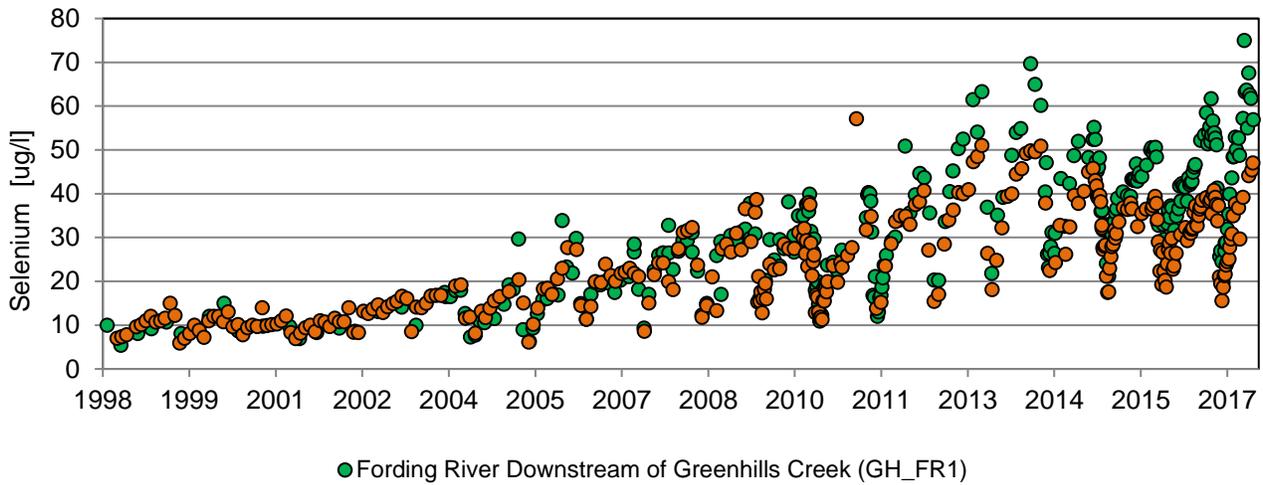

Figure 71. Historical selenium concentrations at Order Stations GH_FR1 and LC_LC5.

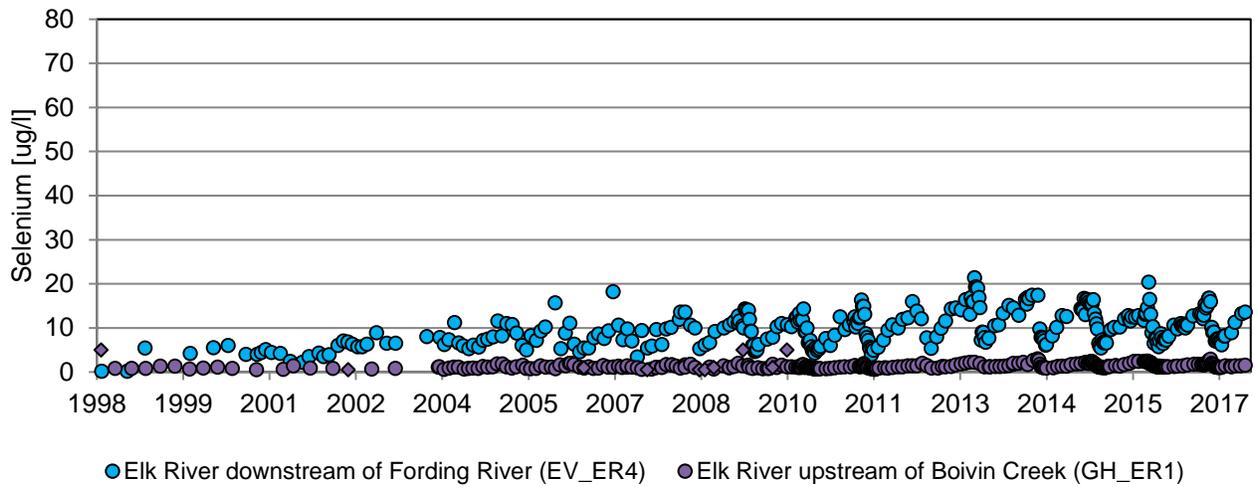

Figure 72. Historical selenium concentrations at EV_ER4 and GH_ER1.

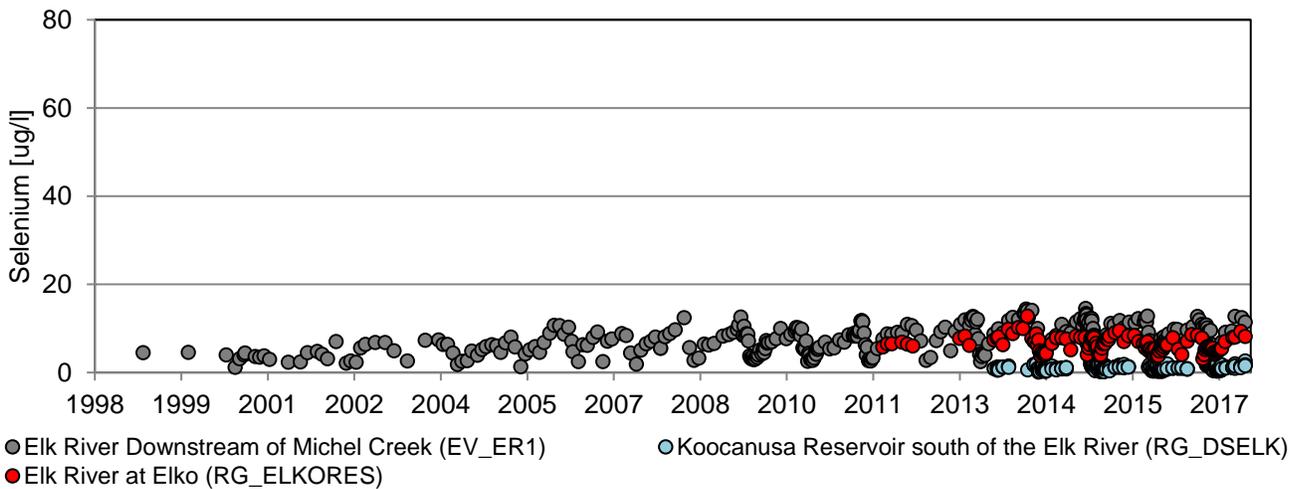

Figure 73. Historical selenium concentrations at EV_ER1, RG_DSELK, and RG_ELKORES

Selenium temporal patterns expressed at Order Stations are influenced by patterns observed at water sampling sites associated with waste rock dumps (i.e., discharge sources). Figure 46 is comprised of four quadrants which illustrate total selenium concentrations recorded at water sampling sites associated with the waste rock dumps compared to concentrations at relevant Compliance Points and Order stations. Water sampling sites in the upper Fording River (upstream of 0200378 (GH_FR1)) are shown in on the upper left. Water sampling sites associated with the lower Fording River (upstream of 0200028 (LC_LC5)) are shown on the upper right. Water sampling sites associated with the Elk River (upstream of 0200027 (EV_ER2)) are shown on the lower left. Water sampling sites associated with the Michel Creek (upstream of E300091 (EV_MC2)) are shown on the lower right. For purposes of illustration, discharge stations with active waste rock dumps have been illustrated using a triangle, discharge stations with dormant waste rock dumps using a square, and receiving environment stations a circle.

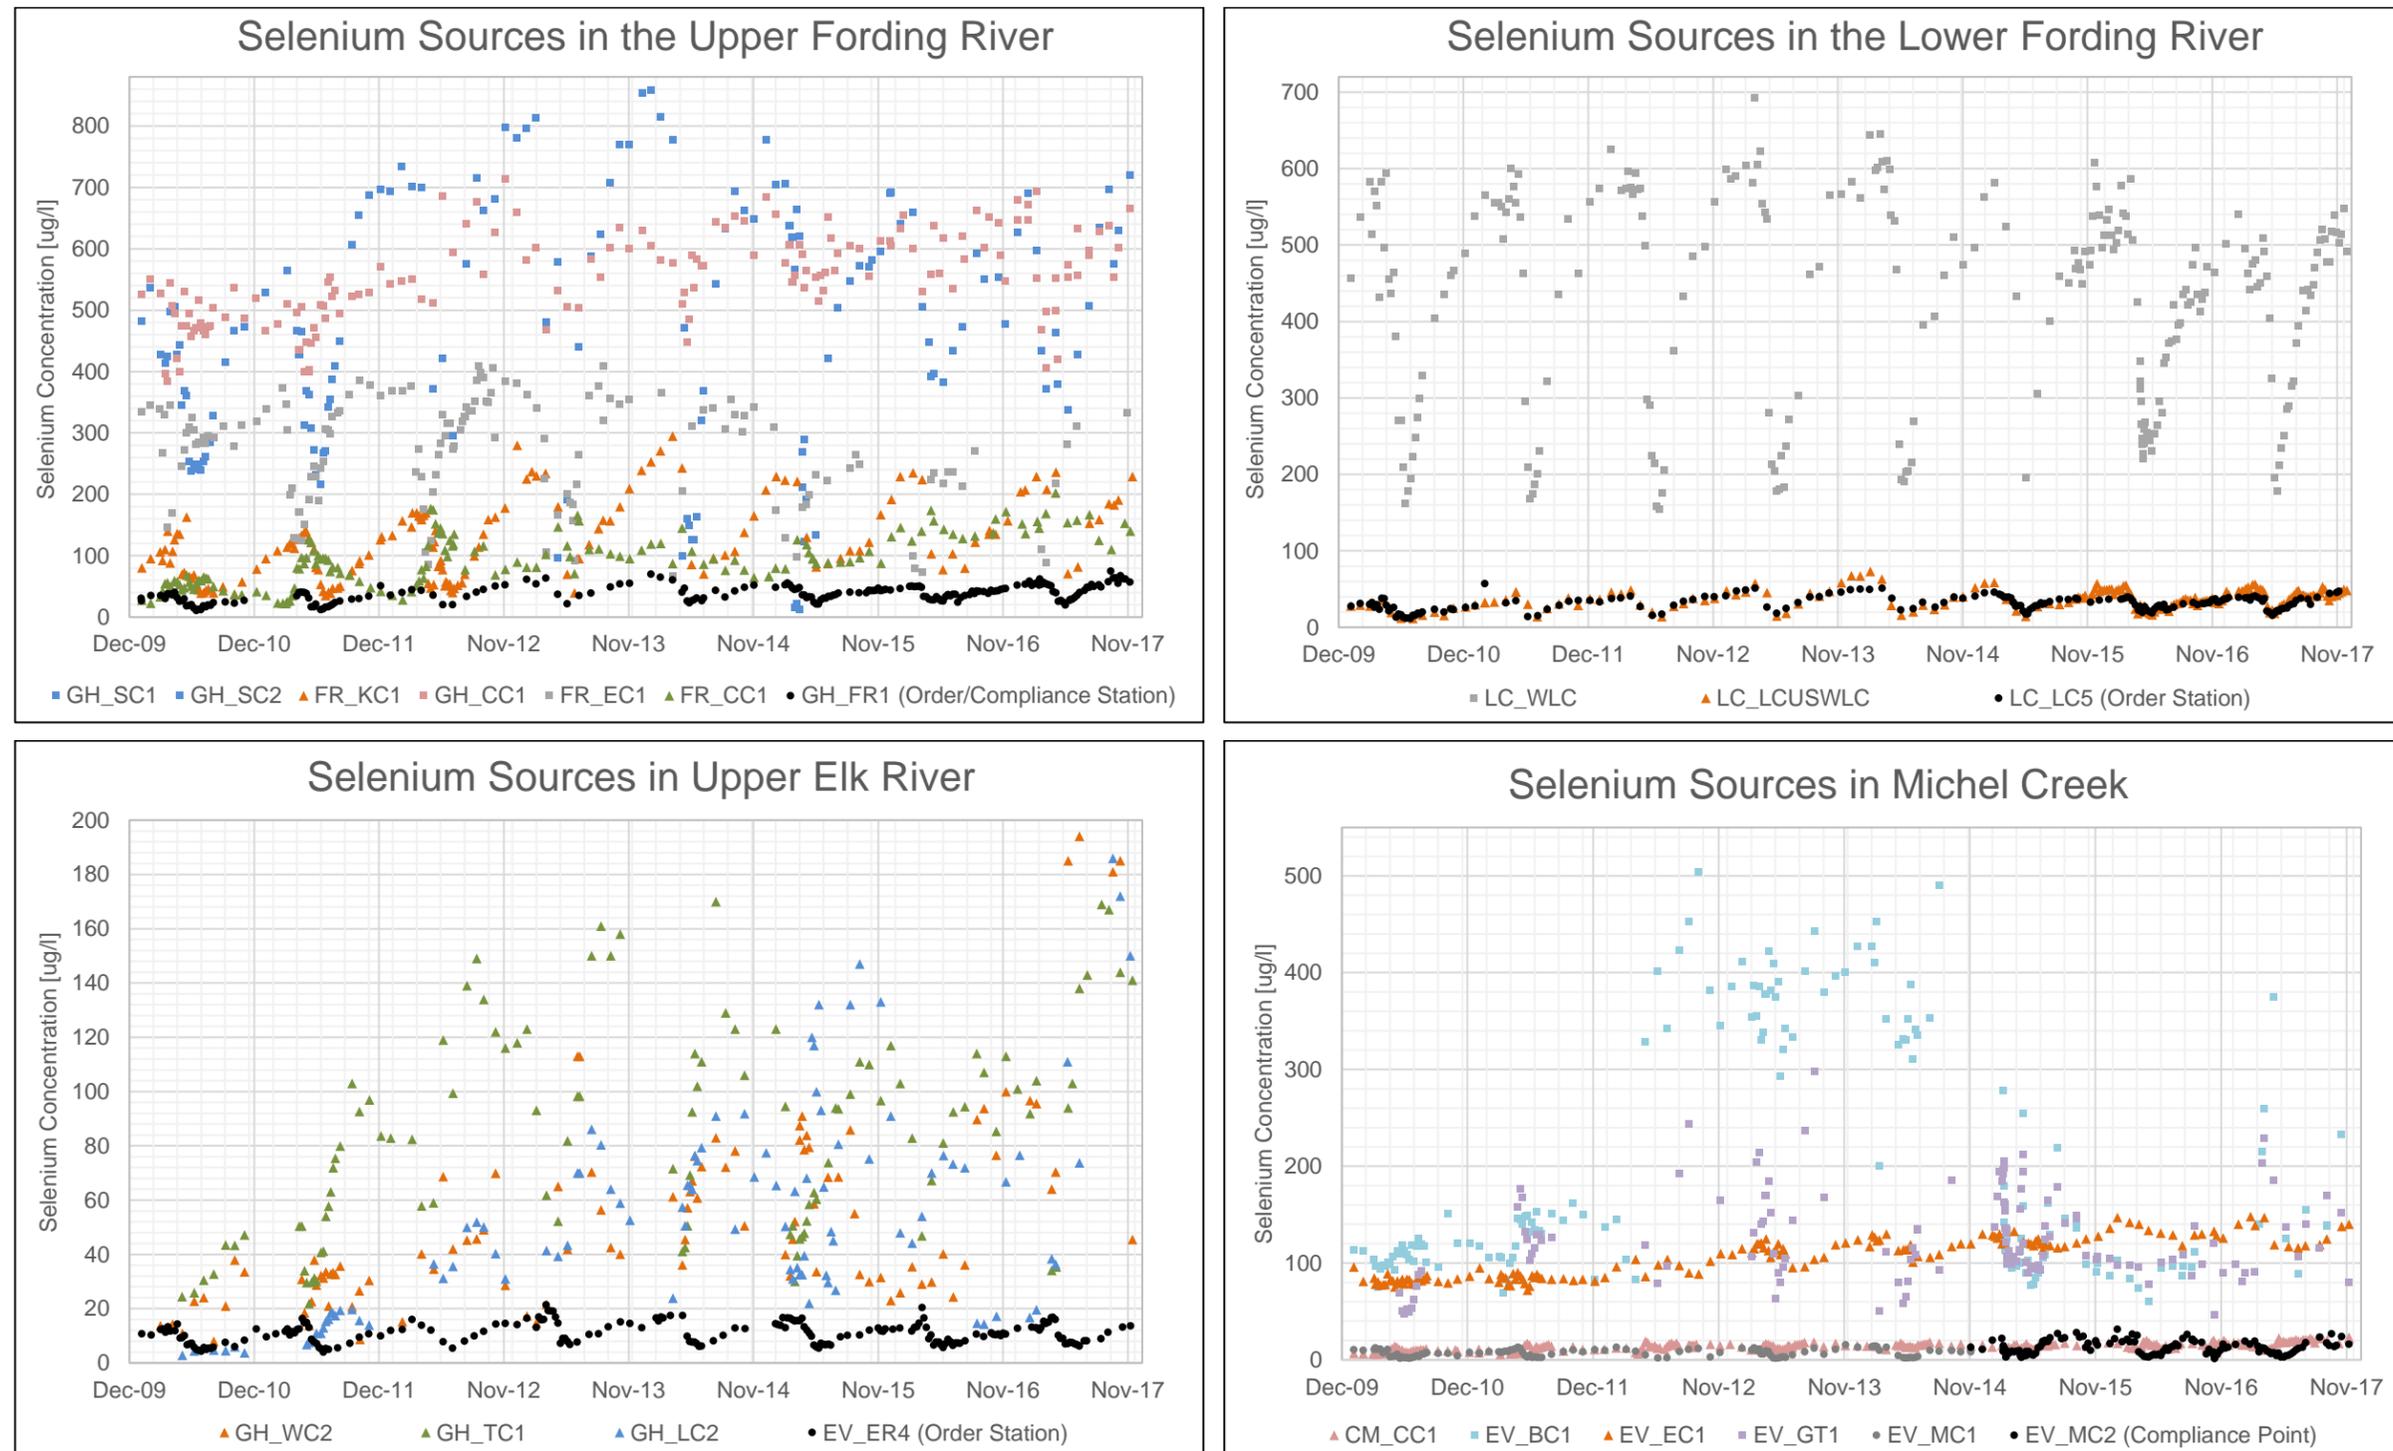

Figure 74. Total selenium concentrations at key source sites in the upper Fording River (top Left), lower Fording River (top right), upper Elk River (bottom left) and Michel Creek (bottom right) compared to relevant Order stations.

Note: Active waste rock dumps are depicted using triangles, dormant waste rock dumps with squares, and downstream monitoring locations with circles.

Monitoring at GH_LC2 and GH_WC2 is not required under 107517, however data are included from these stations instead of GH_LC1 (E257796) and GH_WC1 (E257795) to show long term trends at Leask and Wolfram creeks.

Data from EV_MC1 were included for this analysis in Michel Creek as it was discontinued when EV_MC2 was implemented further upstream as part of the implementation of Permit 107517 in 2014. This change was made to exclude and potential surface water sources or dilution between sites.

Based on data collected to date, it does not appear that waste rock dump status (active vs. dormant) directly influences surface water selenium concentrations. However, and as illustrated within Figure 45, selenium concentrations from some upstream sources have a direct correlation with the patterns of selenium concentrations observed in downstream receiving environments which peak in low flow months and have the lowest concentrations in freshet.

5.3.2 Nitrate-N

Similar to selenium, nitrate-N concentrations have increased within the Elk Valley watershed over time. Data collected by Environment Canada and its partners at long-term water quality surveillance monitoring station BC08NK0003 show that nitrate concentrations (Figure 72) follow a similar pattern observed for selenium at this station (refer to Figure 67). Nitrate-N data collected and presented for monitoring station BC08NK0003 is for [nitrate + nitrite]-N and as such, slightly over-estimates actual nitrate concentrations. However, for purposes of illustrating the overall trend to date it represents the oldest and most consistent data set.

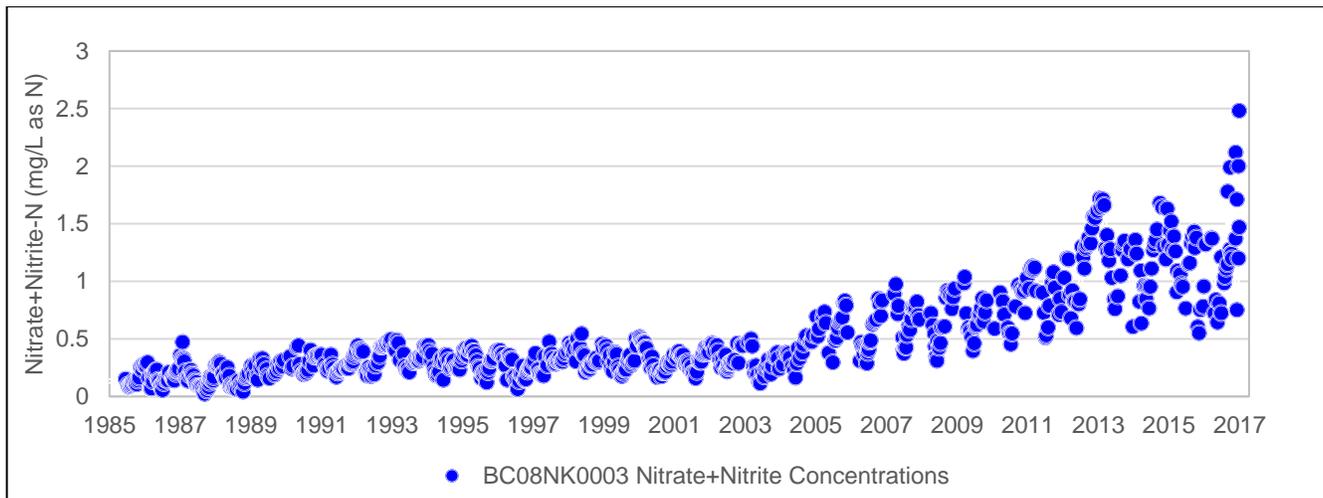

Figure 75. [Nitrate + Nitrite]-N concentrations recorded at water quality surveillance monitoring station BC08NK0003 in the Elk River.

Note: Data were accessed from <http://www.ec.gc.ca/eaudouce-freshwater/default.asp?lang=En&n=EFDA57C6>

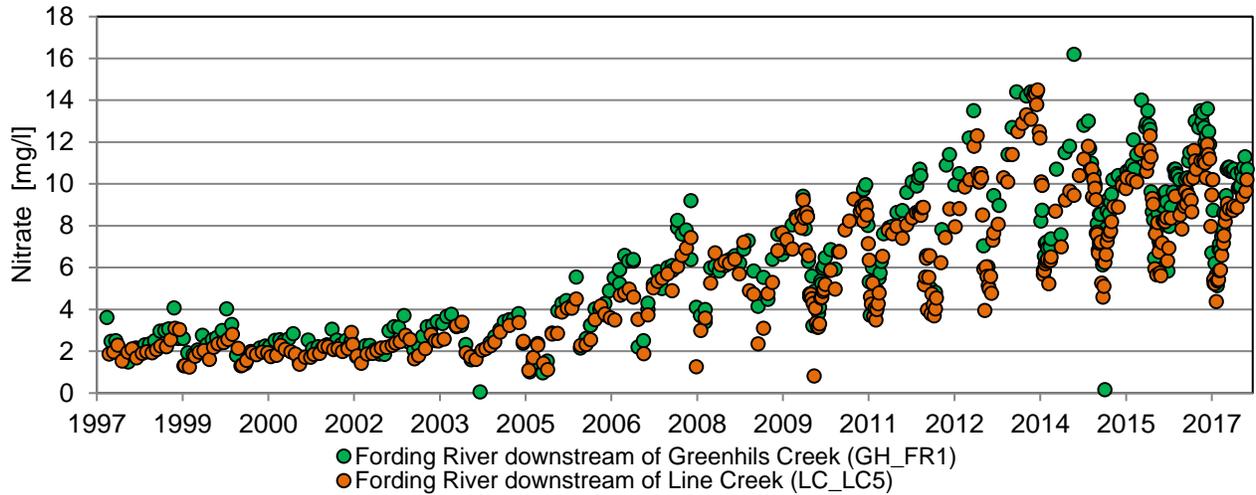

Figure 76. Historical Nitrate concentrations at GH_FR1 and LC_LC5.

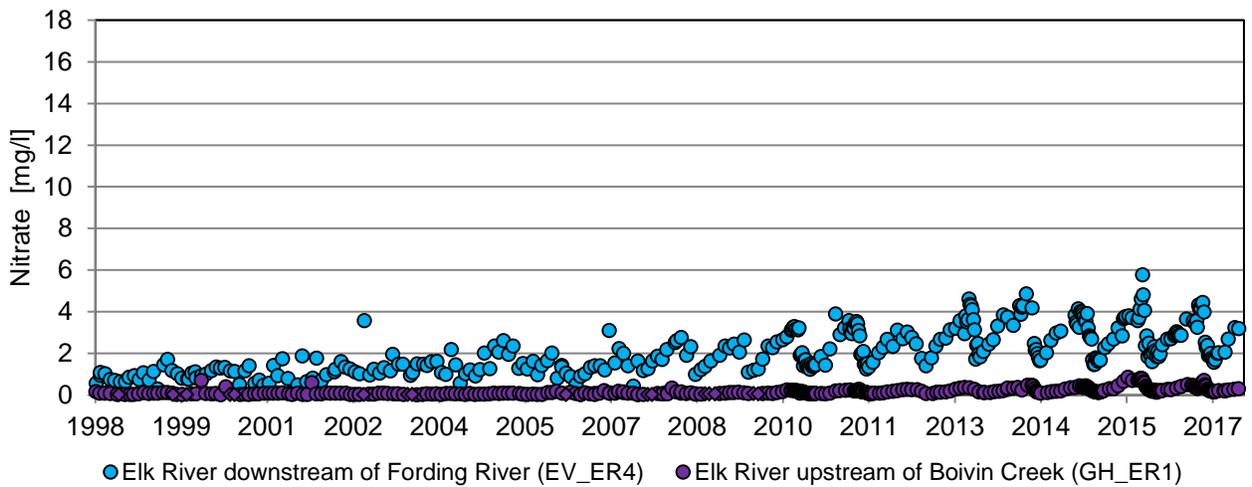

Figure 77. Historical nitrate concentrations at EV_ER4 and GH_ER1.

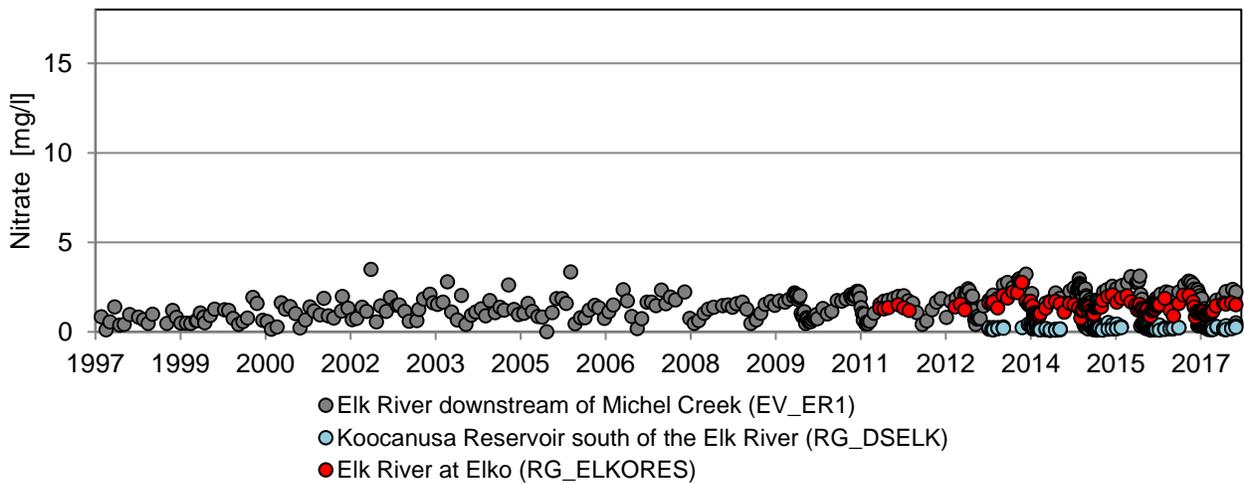

Figure 78. Historical nitrate concentrations at EV_ER1, RG_DSELK, and RG_ELKORES.

Temporal variability observed in (nitrate + nitrite)-N data at BC08NK0003 tracks very closely to that observed in the selenium data. Similar temporal patterns can also be seen at upstream Order Stations.

Based on data collected to date by Teck, nitrate-N concentrations at 0200378 (GH_FR1) and 0200028 (LC_LC5) the highest concentration was measured in 2014 (16.2 mg/l at GH_FR1 and 14.5 mg/l at LC_LC5, Figure 73).

Like selenium, nitrate-N temporal patterns expressed at Order Stations are associated with concentrations observed at some waste rock dumps (Figure 76). Consistent with selenium data plots, water sampling sites in the upper Fording River (upstream of 0200378 (GH_FR1)) are shown in on the upper left. Water sampling sites associated with the lower Fording River (upstream of 0200028 (LC_LC5)) are shown on the upper right while water sampling sites associated with the Elk River (upstream of 0200027 (EV_ER2)) are shown on the lower left. Water sampling sites associated with the Michel Creek (upstream of E300091 (EV_MC2)) are shown on the lower right. Active waste rock dumps are depicted using triangles, dormant waste rock dumps with squares, and Order Stations with circles.

A key difference from the selenium data above is that nitrate-N concentrations associated with some dormant waste rock dumps appear to have a decreasing trend or have remained fairly constant. This is consistent with the conceptual model for nitrate release which attributes elevated nitrate concentrations in watercourses downstream of Teck's waste rock spoils to residual nitrogen compounds from explosives used during mining. This residual is rinsed over time and concentrations decrease.

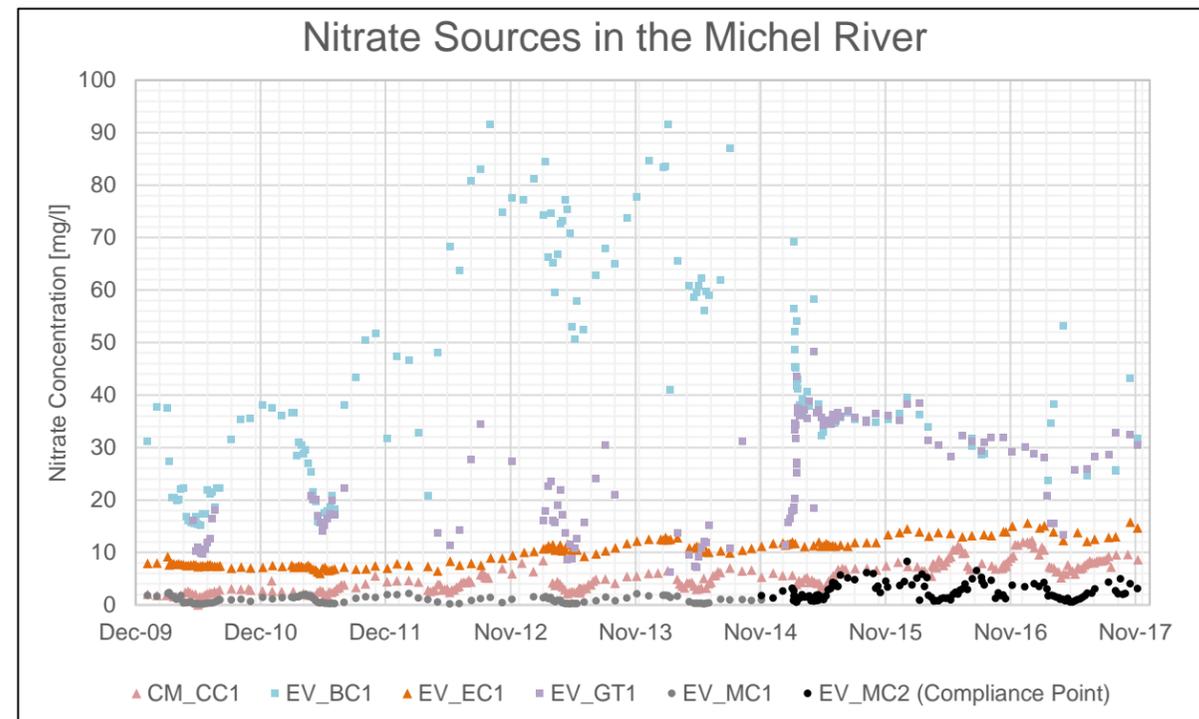

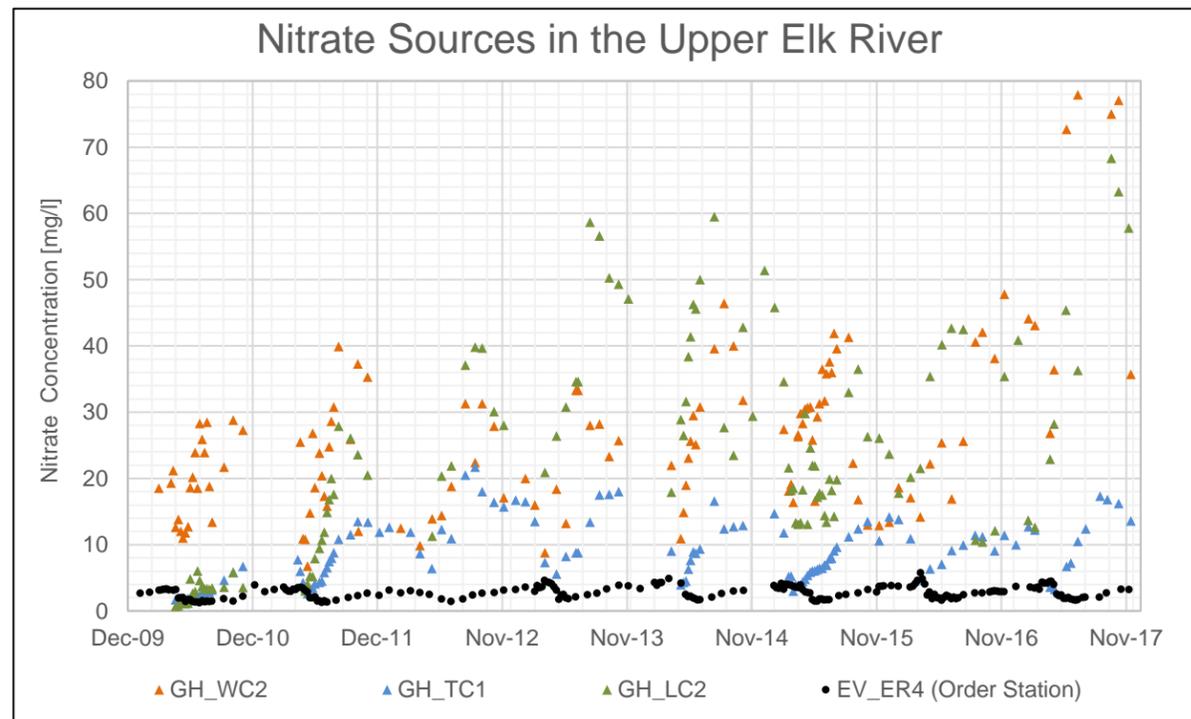

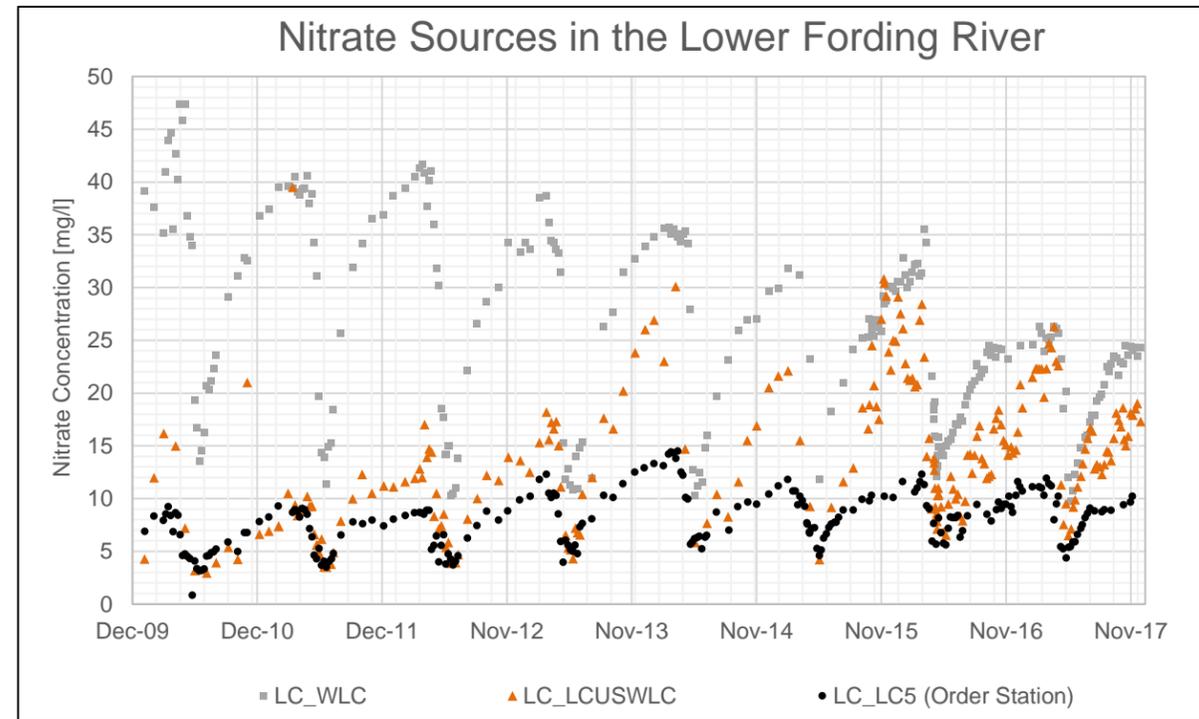

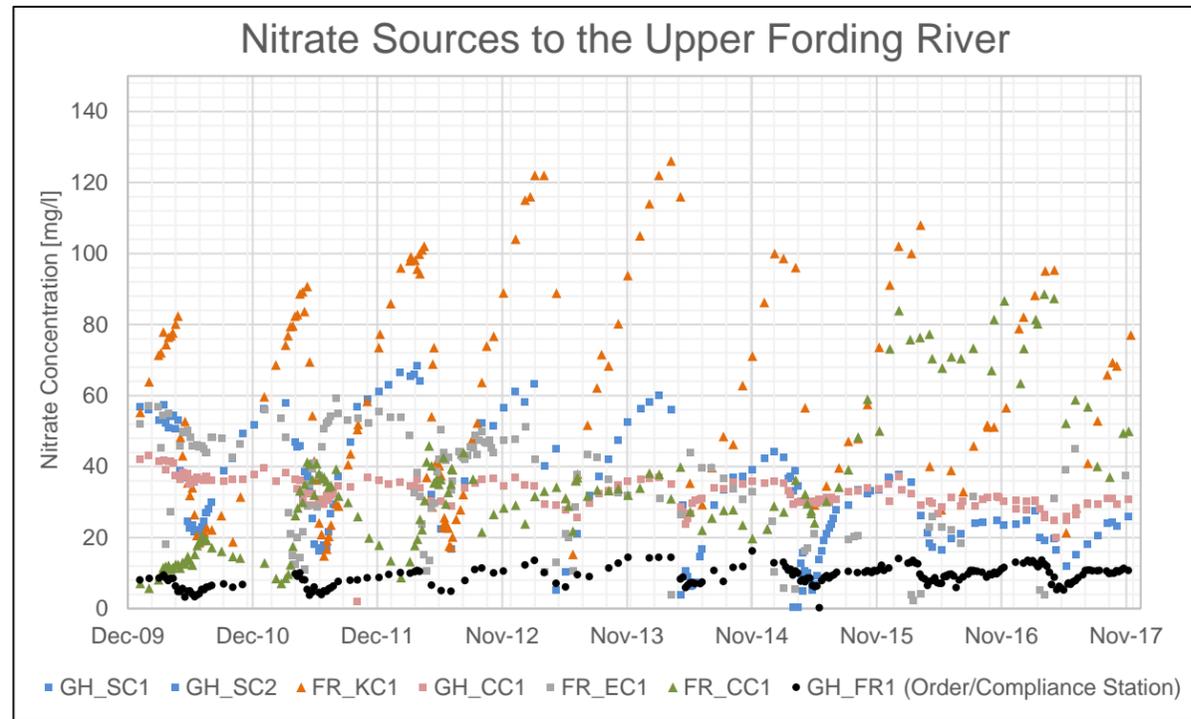

Figure 79. Nitrate- N concentrations at key source sites in the upper Fording River (top Left), lower Fording River (top right), upper Elk River (bottom left) and Michel Creek (bottom right) compared to relevant Order stations.

Note: Active waste rock dumps are depicted using triangles, dormant waste rock dumps with squares, and downstream monitoring Locations with circles.

Monitoring at GH_LC2 and GH_WC2 is not required under 107517, however data are included from these stations instead of GH_LC1 (E257796) and GH_WC1 (E257795) to show long term trends at Leask and Wolfram creeks. Data from EV_MC1 were used for this analysis in Michel Creek as it was discontinued when EV_MC2 was implemented further upstream as part of the implementation of Permit 107517 in 2014. This change was made to exclude and potential surface water sources or dilution between sites.

5.3.3 Sulphate and Cadmium

Concentrations of both sulphate and cadmium are below the thresholds for which treatment would be required under the Elk Valley Water Quality Plan, as such; no treatment is planned for sulphate and cadmium. There are spatial and temporal patterns observed in sulphate data that mirror those of selenium; these patterns reflect the oxidation of sulfur-bearing minerals within the waste rock dumps (e.g., pyrite). Based on data collected to date, sulphate concentrations recorded at Order Stations show an increasing trend peaking in and then maintaining a fairly constant seasonal pattern (Figure 78-80) with the exception of GH_FR1 in which the upward trend is continuing, peaking in 2017 at 313 mg/L. Figure 81 shows temporal trends in sulphate concentrations at upper and lower Fording River, Elk River, and Michel Creek. Like selenium, sulphate temporal patterns expressed at Order Stations are associated with concentrations observed at key waste rock dumps (Figure 81).

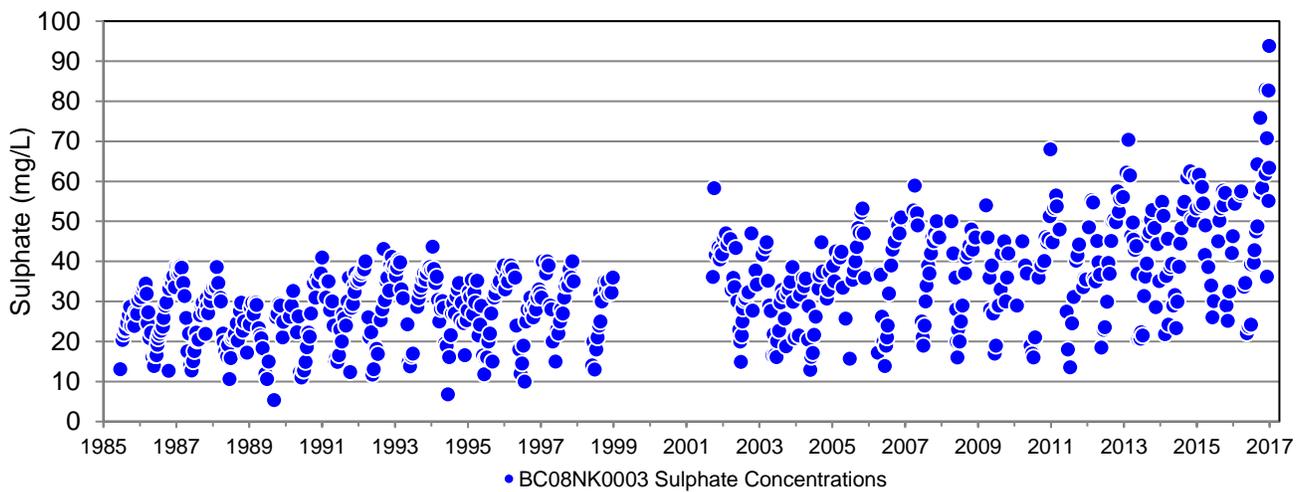

Figure 80. Sulphate concentrations recorded at water quality surveillance monitoring station BC08NK0003 in the Elk River.

Note: Data were accessed from <http://www.ec.gc.ca/eaudouce-freshwater/default.asp?lang=En&n=EFDA57C6>

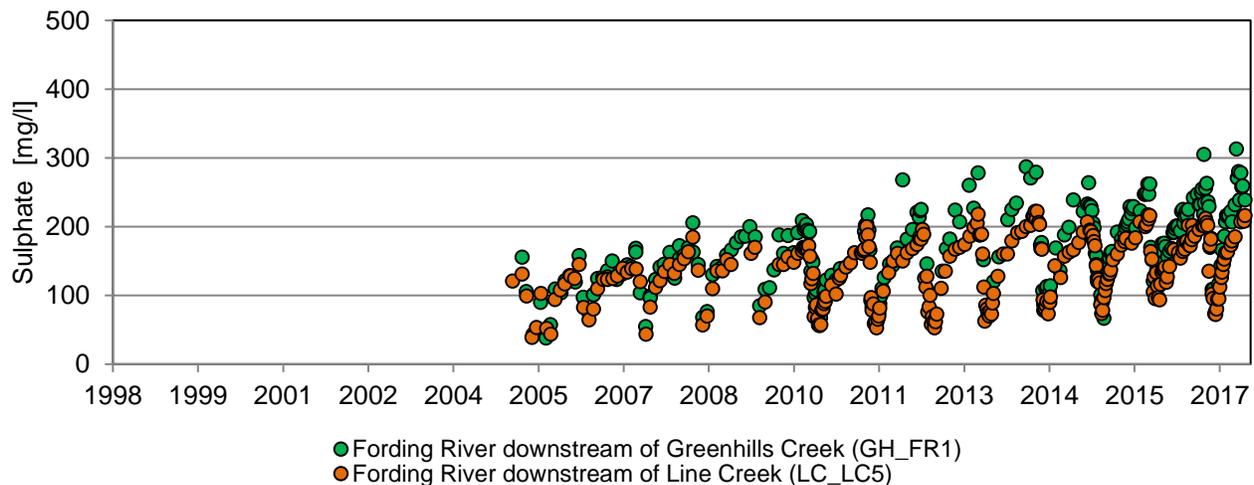

Figure 81. Historical sulphate concentrations at GH_FR1 and LC_LC5.

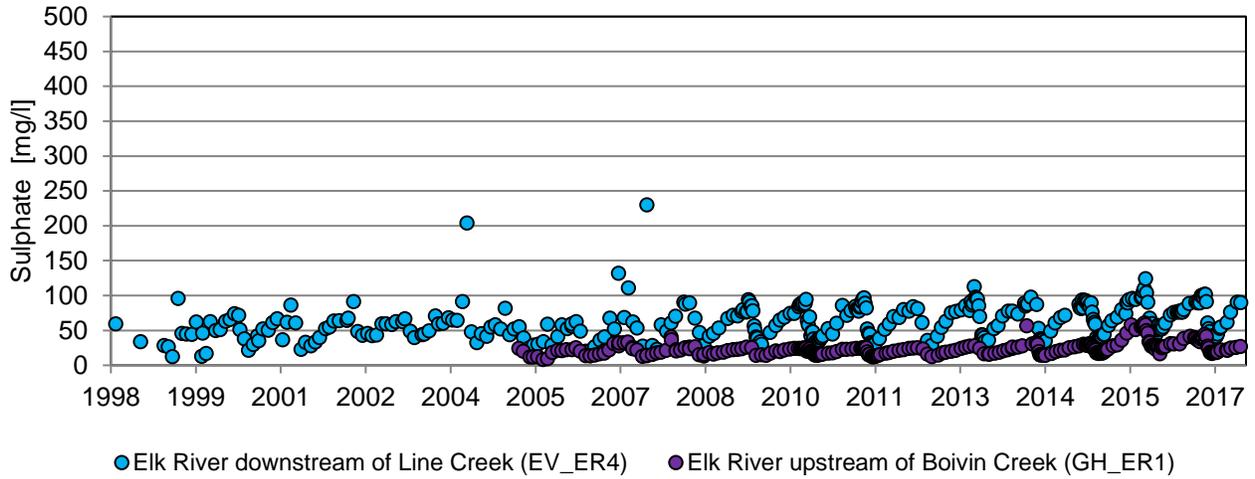

Figure 82. Historical sulphate concentrations at EV_ER4 and GH_ER1.

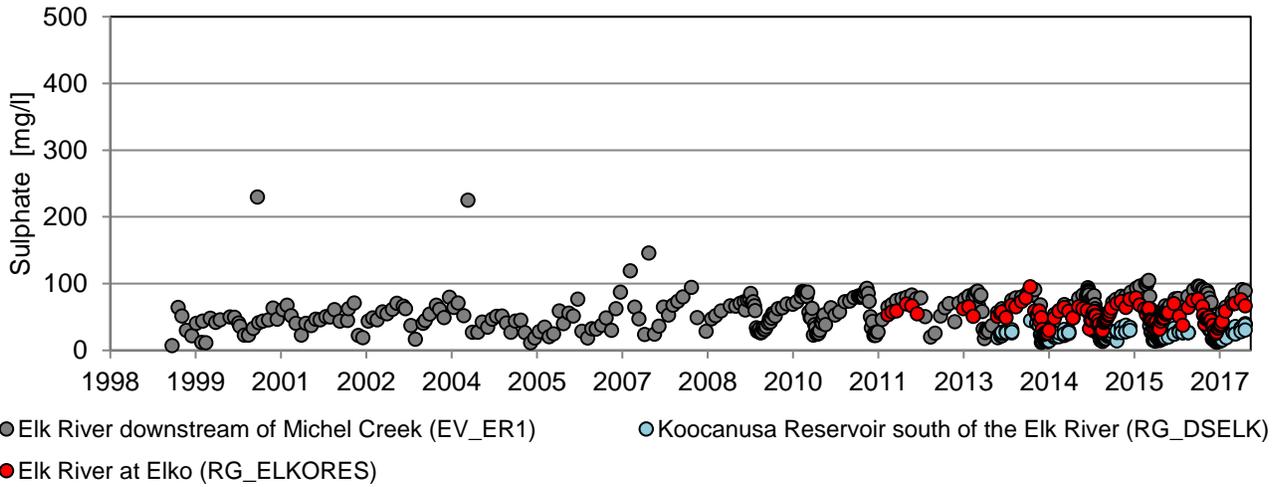

Figure 83. Historical sulphate concentrations at EV_ER1, RG_DSELK, and RG_ELKORES.

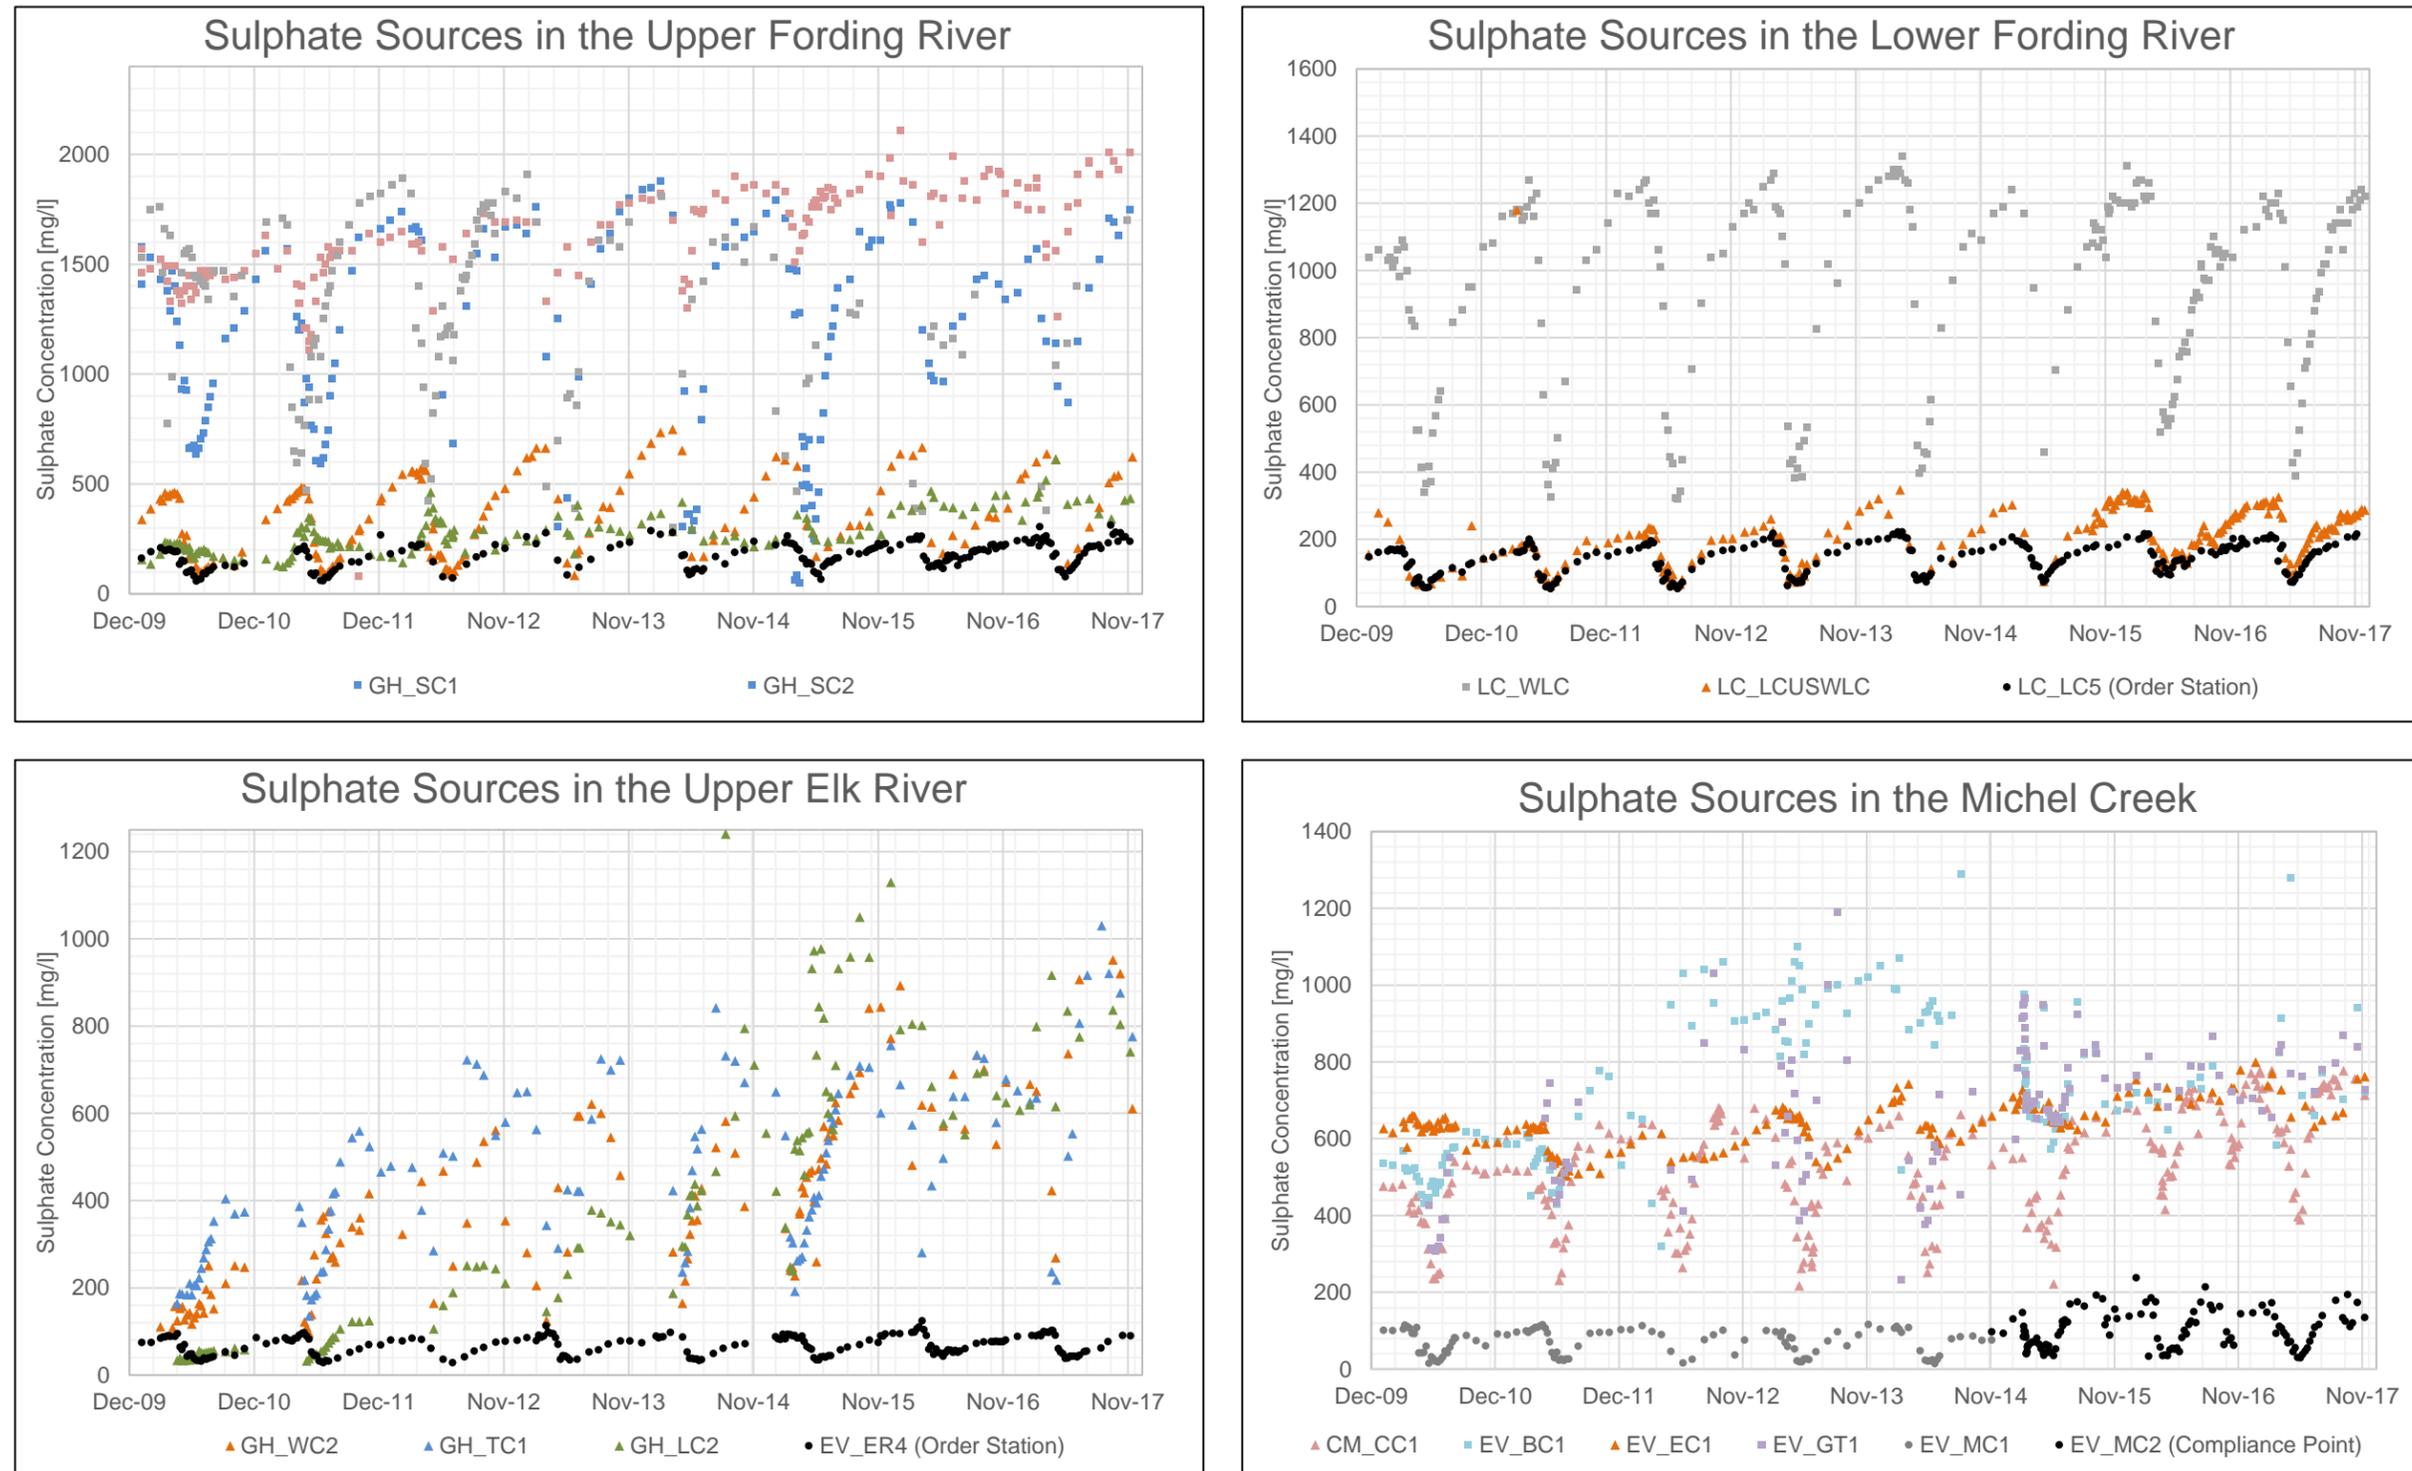

Figure 84. Sulphate concentrations at key source sites in the upper Fording River (top Left), lower Fording River (top right), upper Elk River (bottom left) and Michel Creek (bottom right) compared to relevant Order stations.

Note: Active waste rock dumps are depicted using triangles, dormant waste rock dumps with squares, and Order Stations within the Fording River with circles.

Monitoring at GH_LC2 and GH_WC2 is not required under 107517, however data are included from these station instead of GH_LC1 (E257796) and GH_WC1 (E257795) to show long term trends at Leask and Wolfram creeks.

Data from EV_MC1 were used for this analysis in Michel Creek as it was discontinued when EV_MC2 was implemented further upstream as part of the implementation of Permit 107517 in 2014. This change was made to exclude and potential surface water sources or dilution between sites.

Unlike other Order-defined constituents of interest, temporal and spatial trends in cadmium data are less apparent (Figure 51). As noted in the EVWQP seasonal cadmium trends within the receiving environment appear to be driven by background conditions. Elevated cadmium concentrations have been observed locally in some tributaries in the valley; however, concentrations in the receiving environment have remained below SPOs. Cadmium data at Order Stations is presented below however, source data is not presented for cadmium as there are no apparent trends or patterns to speak of. Continued surface water monitoring for cadmium will help improve clarity and ability to discern relationships and patterns.

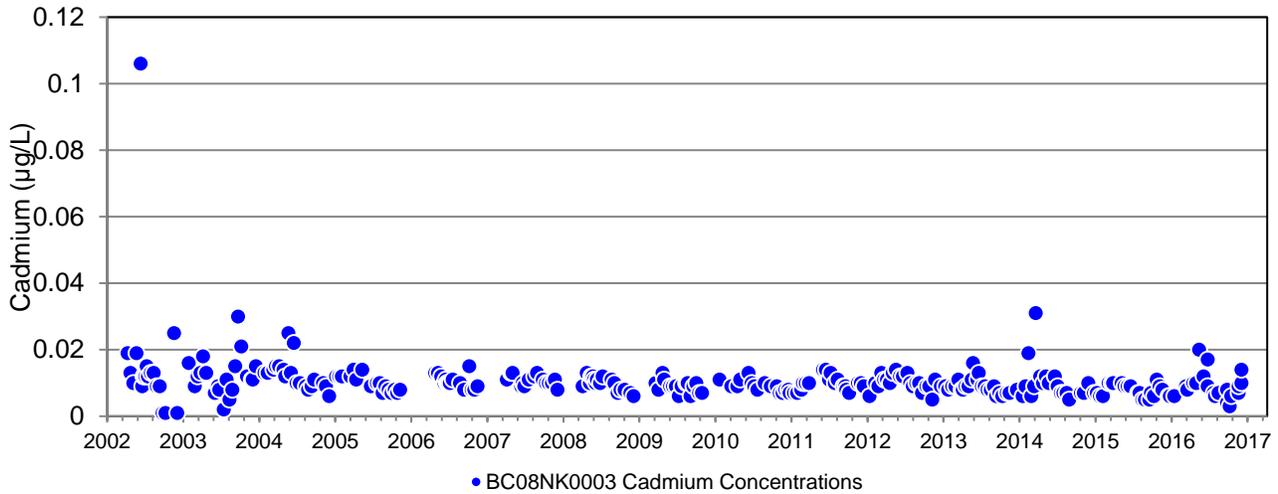

Figure 85. Cadmium concentrations recorded at water quality surveillance monitoring station BC08NK0003 in the Elk River.

5.3.4 Conceptual Model for Water Flow Through Waste Rock and Constituent Release³

The waste rock hydrology conceptual model is linked closely with conceptual models of water quality constituent release. Several field studies and associated publications have been completed and contributed to the understanding of water flow within waste rock. Field studies have been conducted at Teck sites by researchers at the University of Saskatchewan and McMaster University on the subject of waste rock hydrology. Literature on instrumented test dumps completed at the Key Lake Uranium mine (Saskatchewan), the Diavik Diamond mine (North West Territories), and the Antamina metals mine (Peru) has also been reviewed. Observations and learnings from these studies are incorporated into the conceptual model described below.

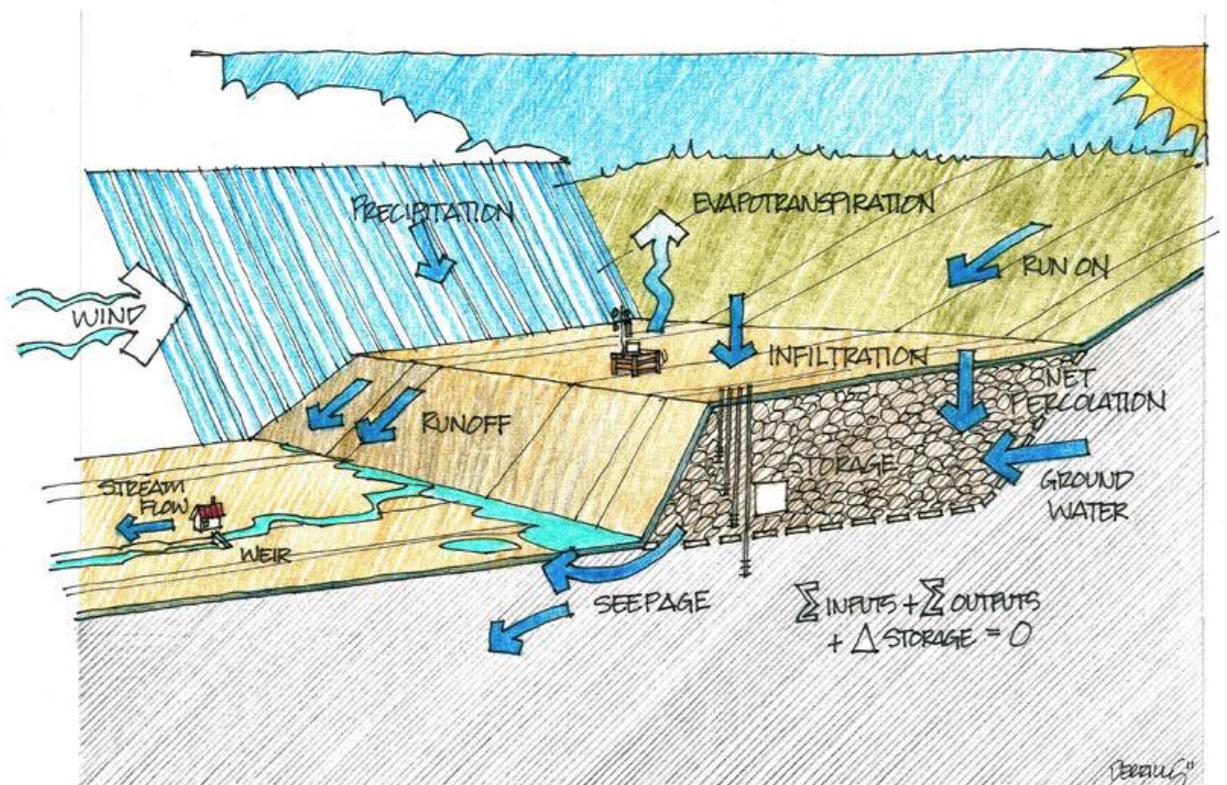

Figure 89. Waste rock conceptual water balance.

The conceptual understanding of the water balance of a waste rock dump is illustrated on Figure 52. The terms illustrated on Figure 52 are highlighted as ***bold italics*** text through this section, as each component is described. Surface ***runoff*** is limited on active waste rock dumps (unreclaimed) due to the porous nature of the media. The primary factor that influences water movement through a waste rock dump is ***infiltration***. ***Infiltration*** rates are primarily influenced by the surface conditions (vegetation cover versus bare rock) and can be influenced seasonally, with infiltration limited during winter conditions. The waste rock dumps are unsaturated although storage occurs in pore spaces.

³ Section 5.3.4 was reproduced from Teck 2017

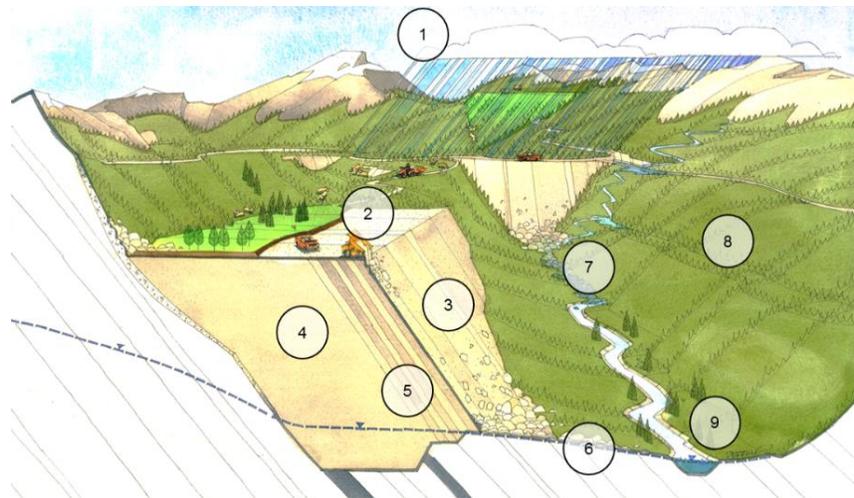

Waste rock is typically placed with very low water content (similar to *in situ* rock water content) and a portion of infiltrating water is typically sequestered by the rock during a period described as “wetting up”. The amount of time required to wet up is dependent on many factors such as dump height, dump construction methods, and climate. **Net percolation** is the term used to describe the water that passes through the waste rock dump.

Water flow through the waste rock dumps is highly variable, both spatially and temporally, due to the textural heterogeneity of the waste rock (Nichol et.al. 2005). The textural variability can be influenced by the dump construction methods. The majority of Teck’s waste rock dumps in the Elk Valley are constructed through end dumping, which results in gravity segregation of the dumped materials. Larger particles, such as boulders and cobbles, tend to roll down the dump face and settle at the bottom, whereas smaller sand, gravel, and silt sized particles remain at the top of the dump face. Near surface flow rates can be high during periods of rapid snow melt or intense precipitation, which can influence the development of preferential flow pathways. Waste rock dumps in the Elk Valley are on average 100 m to 200 m thick with some as thick as 300 m. The large thickness of waste rock dumps dampens the effects of episodic recharge events so that at the base of waste rock dumps studied in the Elk Valley, **net percolation** is relatively constant throughout the year (Barbour et. al. 2016).

Run-on (run off from up-gradient natural catchment areas) is understood to dominantly flow through the coarse rubble zone at the base of the dump (also referred to as rock drains) and has little interaction with the bulk of the overlying waste rock materials, though some saturation of the base of the dump may occur seasonally during high flow periods (Villeneuve et. al. 2017). Run-on from natural drainage is highly seasonal and this natural drainage, when combined with the **seepage** from the overlying waste rock mass can result in strong seasonal variation in the water quality that emerges from the base of the waste rock dumps. **Groundwater** flow systems or near surface flow pathways underlying waste rock are conceptually understood on a site-by-site basis. Groundwater discharging into the base of a waste rock dump (along buried creek channels) are likely to flow through the same rock drains as run-on and have little interaction with the overlying mass. **Seepage** is often difficult to characterize on its own due to mixing with the run-on and groundwater at points of measurement at the base of the waste rock dump or further downstream at long-term monitoring locations.

The factors presented in the waste rock hydrology conceptual model support the understanding that flow through a waste rock dump is not an instantaneous process, and that there is a hydrologically controlled delay (lag) between the placement of waste rock and the appearance of load in the receiving environment. The length of that lag is dependent up on the waste rock dump specific factors and local climate factors, among others.

The conceptual model for water quality constituent release and transport is focused primarily on unsaturated waste rock, building upon the concepts in the conceptual model for waste rock hydrology. The conceptual model for water quality constituent release and transport in unsaturated waste rock is illustrated and described in Figure 53.

1	<p>Net Percolation</p> <ul style="list-style-type: none"> The amount of water that enters from the surface of the waste piles is a function of precipitation and snowmelt minus evaporation, transpiration and sublimation. Run-off from the unsaturated waste rock is negligible
2	<p>Rock placement and physical conditions</p> <ul style="list-style-type: none"> Waste placement is tracked as bank cubic metres (BCM) of waste placed per year and is a primary factor in source term development. The method of construction can influence the flowpaths that constituents of interest (CIs) travel to exit the waste piles.
3	<p>Leaching of explosives residuals contributes inorganic nitrogen (e.g., nitrate) to contact waters</p> <ul style="list-style-type: none"> Leaching of explosives residuals are expected to diminish with time since a finite amount of explosives are introduced during mining and nitrogen forms are not expected to be generated significantly by rock weathering. The amount of NO₃ present is a function of placed waste rock, powder factor, management practices, wet/dry holes, blast utilization and is present dominantly as NO₃.
4	<p>Geochemical weathering processes under oxygenated conditions</p> <ul style="list-style-type: none"> Oxidation of pyrite results in release of soluble components of pyrite, mainly sulphate, but also traces of elements including selenium and other metals. Dissolution of acid-neutralizing minerals and release of soluble components of those minerals, mainly base cations (calcium, magnesium). Throughout the unsaturated waste rock, it is assumed that pyrite oxidation is not oxygen limited. There is a strong regional correlation of selenium to sulphate. The interaction of reactive surfaces (e.g. iron oxides) may attenuate elements, e.g. cadmium, and precipitation of secondary minerals such as gypsum may control sulphate concentrations. Waste rock may break down over time, exposing new surface areas as a result of compaction, physical weathering etc.
5	<p>Hydrological processes that may influence release of CIs from waste rock</p> <ul style="list-style-type: none"> There are leaching inefficiencies within the waste piles that are difficult to quantify whereby not all pore spaces are leached by infiltrating waters. This can be influenced by dump height, grain size etc. When waste rock piles are disturbed (e.g. during rehandling), pore spaces not previously leached may leach. Travel time through the waste rock pile is believed to be largely a function of lift height and net percolation.
6	<p>Transport of CIs via seepage, run-off and groundwater pathways</p> <ul style="list-style-type: none"> Water carrying CIs from the dump exit the dump as surface water and groundwater. Negligible run-off occurs and groundwater pathways are expected to be minimal on a regional scale reporting ultimately to the Elk River. Where groundwater pathways occur, there is a potential for load bypass at specific monitoring stations and sub-oxic reduction of Se and NO₃.
7	<p>In-stream precipitation processes</p> <ul style="list-style-type: none"> As seepage with high partial pressure of CO₂ exits the waste rock pile and equilibrates with the atmosphere, calcite becomes supersaturated and precipitates within the streams. Trace metals such as cobalt and cadmium (among others) have been shown to co-precipitate with calcite when this occurs. The precipitation of calcite is affected by seasonal changes in flow whereby during high flows and spring freshet, streams are diluted and calcite does not precipitate. During this period some trace metals concentrations (e.g. Co) tend to parallel sulphate trends in the receiving environment.
8	<p>Undisturbed area influences</p> <ul style="list-style-type: none"> Dilution from undisturbed areas varies by drainage and influences the monitoring station flow and water quality. A load is associated with this undisturbed area, and the relative proportion varies by constituent.
9	<p>Monitoring location and data record</p> <ul style="list-style-type: none"> Source term development requires data for flow and water chemistry. The extent of monitoring record varies across the region. Some stations have robust data sets while others are limited. Recent data (<10 years) tends to be more complete, while older data are sometimes limited.

Figure 90. Geochemical conceptual model for unsaturated waste rock (modified from source: SRK 2017).

5.4 Toxicity

5.4.1 Acute Toxicity

Two hundred and ten (210) 96-h rainbow trout 100% (single concentration) acute lethality toxicity tests and 235 48-h *Daphnia magna* 100% (single concentration) acute lethality toxicity tests were conducted in 2017 as a requirement of Permit 107517. Of the 235 *D. magna* acute toxicity tests, ten (4.3%) exhibited >50% mortality and as such were considered failed test results based on Permit 107517 criteria. There were no failures of rainbow trout toxicity tests in 2017 (i.e., mortality was ≤50% for all 2017 rainbow trout acute toxicity tests). A summary table of acute toxicity test results is provided in Appendix G. Failed toxicity testing results are listed below in Table 20.

In response to the failed toxicity testing results, Teck followed the requirements of Permit 107517 Section 10.2.2 with respect to confirmatory testing (i.e., LC₅₀ follow-up tests), took immediate corrective action where possible, and provided follow-up test information to applicable regulators and KNC when it became available. Teck also completed additional investigative testing (e.g., testing at 10 and 20°C as well as other Toxicity Identification Evaluation [TIE] investigations) to aid in identifying the cause(s) of toxicity.

Table 20. Failed 48-hour *Daphnia magna* acute toxicity tests and results.

EMS	Site ID	Date	48-h <i>Daphnia magna</i> (single concentration) Units of % Mortality	Field Temperature (°C) Measured in Samples for Acute Toxicity Tests
0200384	GH_CC1	03/21/2017	90	1.9
E3E06924	FR_LMP1	04/21/2017	93	2.2
0200384	GH_CC1	05/08/2017	100	3

E291569	WL_BFWB_OUT_SP21	08/08/2017	87	12.3
0200384	GH_CC1	08/08/2017	67	7.1
E291569	WL_BFWB_OUT_SP21	09/18/2017	100	9.3
0200384	GH_CC1	11/01/2017	100	1.9
E221329	GH_SC1	11/01/2017	93	3.2

Teck currently hypothesizes, based on the results of additional investigative studies and recent scientific literature (e.g., Bogart et al. 2016), that the formation of one or more mineral precipitates (including but not necessarily limited to calcite) was responsible for adverse effects observed in most or all of the failed *D. magna* tests. Evidence supporting this hypothesis includes:

- Laboratory staff noted precipitate consistent with calcite on the surfaces of the test vessels and *D. magna* carapaces during acute toxicity tests in which adverse effects on survival were observed. These observations are consistent with precipitate-related test mortalities in *D. magna* (Bogart et al. 2016).

- In the TIE studies, treatments that reduced precipitate formation, including treatments with antiscalant and treatments that reduced calcium and/or carbonate in solution (i.e., the components of calcite), substantially reduced or eliminated toxicity and precipitate formation.
- *D. magna* acute toxicity tests conducted at 10°C showed reduced toxicity compared to tests run at 20°C per Environment Canada guidelines. Because calcite solubility decreases with increasing temperature, the standard test protocol of warming samples to 20°C has the potential to enhance precipitation during the test in samples in which calcium and carbonate are super-saturated at 20°C.
- Treatment of effluent samples with antiscalant during pilot testing for advanced oxidation process at the active water treatment reduced or removed acute toxicity to *D. magna*.
- Tests completed with extended hold times showed reduced toxicity, consistent with giving time for precipitate to form prior to the addition of *D. magna*
- Effluent chemistry and TIE results did not identify other potential causes of toxicity (e.g., metals or TDS concentrations).

For acute toxicity test failures in 2017, tests conducted at the lower temperature (10°C) were generally more representative of temperature conditions in the field during the time of collection (1.9 – 12.3°C). At mainstem Fording River sites upstream (FR_FR4) and downstream (FR_FRCP1) from GH_CC1, temperatures in 2017 ranged from -0.1 to 14.5°C; temperatures at these sites measured on or around the 2017 dates of the acute toxicity test failures observed at GH_CC1 ranged from 0.3 to 14.5°C. Temperatures measured downstream of the WLC AWTF at LC_LC3 (i.e., downstream of WL_BFWB_OUT_SP3) ranged from 6.6 to 8.5°C on or around the dates of the acute toxicity failures observed in 2017 at WL_BFWB_OUT_SP21; the maximum daily temperature observed in 2017 at LC_LC3 was 9.3°C. The maximum daily temperature observed in 2017 was 7.4°C (May 31) at GH_CC1 and 14.8°C at WL_BFWB_OUT_SP21 (July 21). The association of test failures with relatively cool field temperatures (typically <10°C) is consistent with the hypothesis that warming the samples to 20°C for testing contributed to adverse effects by promoting precipitate formation.

In 2012 to 2015 near the northern portions of Teck's operations, the mainstem Fording River had maximum temperatures of ~15-19°C (Cope et al. 2016). Test failures were not observed in 2017 under such relatively warm field conditions. For example, in 2017, the two highest temperatures at WL_BFWB_OUT_SP21 (14.8 and 13.5°C) were observed on July 16 and 17; acute *D. magna* tests passed on July 17 with <50% mortality, although variability in *D. magna* response was observed between the two laboratories conducting the tests. Acute *D. magna* toxicity test failures that occurred in 2016 at GH_CC1 were observed when field temperatures of Cataract Creek were <10°C. The results of the acute toxicity tests conducted at 10 and 20°C are useful in evaluating risk of acute toxicity to invertebrates under actual environmental conditions. Results of the acute toxicity tests should be interpreted within the context of the temperatures and water quality in the effluent and receiving environments at the time of a failure.

Trace element concentrations in water samples associated with acute toxicity test failures were generally below Canadian Council of Ministers of the Environment (CCME) Water Quality Guidelines for the Protection of Aquatic Life (CCME 1999). In TIE testing, chelation with EDTA (a treatment to remove metal toxicity) did not reduce toxicity but antiscalant treatment reduced or removed toxicity without reducing concentrations of total dissolved solids (TDS). These results indicated that other trace elements or TDS were not causing the observed toxicity.

In one instance in which a single failure of the *D. magna* acute toxicity test occurred at FR_LMP1 in 2017, toxicity did not appear to be caused by calcite; however, acute toxicity was not observed in subsequent TIE investigations (i.e., the toxicity dissipated in between the initial test and when the TIE investigation was conducted). Total aluminum and iron concentrations were noted to be elevated in the FR_LMP1 sample but dissolved concentrations were below BC WQG. It is possible that precipitation in the FR_LMP1 effluent occurred during sample storage, which may have reduced the toxicity of the effluent. Laboratory staff noted precipitate on the bottom of the test vessel during the original *D. magna* single concentration acute toxicity test. The cause of toxicity could not be definitively determined in this sample.

In 2017, failures of *D. magna* acute toxicity tests were most commonly observed at GH_CC1 (no active water treatment) and WL_BFWB_OUT_SP21 (active water treatment). Active water treatment at Cataract Creek (GH_CC1) is planned as part of the Fording River South AWTF. Results of follow-up studies conducted at 10°C, with antiscalant treatment, as well as other TIE investigations and acute toxicity tests repeated in multiple laboratories for these two locations generally supported the hypothesis that a mineral precipitate (e.g., calcite) is responsible for the *D. magna* acute toxicity. Adverse effects in *D. magna* were typically reduced or eliminated when acute toxicity tests were conducted at lower temperatures or with addition of antiscalant, and under TIE conditions that reduced toxicity associated with carbonate precipitation, although results of some of the TIE tests were inconclusive as the original acute toxicity was not observed during the follow-up investigations. Acute toxicity and TIE laboratory reports are provided in Appendix H.

Teck is currently drafting a Compliance Action Plan that identifies short-term actions and Key Performance Indicators to support the goals of 1) identifying the cause(s) of *D. magna* acute toxicity failures and 2) meeting the Permit 107517 requirement that effluent must not be acutely toxic. As calcite is suspected to be responsible for adverse effects on *D. magna*, it is necessary to understand what factors may favour precipitate formation and determine if these factors are due to laboratory conditions. The draft Compliance Action Plan will identify additional laboratory tests that will help determine which factors may be contributing to observed *D. magna* toxicity and under what conditions toxicity may occur. Because differences in laboratory effluent handling procedures and testing protocols may have contributed to the observed variability in *D. magna* response, the draft Compliance Action Plan will also include an objective to develop and implement standardized laboratory testing protocols for use during acute toxicity testing.

In addition to laboratory studies, the results of calcite monitoring programs at sites throughout the Elk Valley will support Teck's understanding of the potential for calcite toxicity in future tests and the implications of these results for conditions in the receiving environment. Treatment designed to prevent calcite formation in AWTF effluent prior to discharge into the receiving environment is being considered meet the acute toxicity requirement in the Permit. The Compliance Action Plan will identify actions and Key Performance Indicators associated with a reduction of calcite formation. The Compliance Action Plan will support Teck's ongoing commitment to the implementation of the EVWQP to improve water quality in the Elk River watershed and meet the conditions detailed in Permit 107517.

5.4.2 Chronic Toxicity

Section 10.3 of Permit 107517 requires that Teck report annually on the Chronic Toxicity program. Chronic toxicity tests were completed in 2017 in accordance with Section 9.8 of Permit 107517. A detailed summary of test results and associated laboratory reports will be prepared and submitted under separate cover by April 30, 2018.

5.5 West Line Creek Active Water Treatment Facility

The West Line Creek Active Water Treatment Facility (WLC AWTF) treats flow from West Line Creek (WLC) and augments flows as necessary with Line Creek, reducing both total selenium and nitrate in the receiving environment in accordance with Permit 107517. In 2017, approximately 1,681,473 m³ of creek water was treated in the plant and 486 kg of selenium and 33,942 kg of nitrate as nitrogen (NO₃-N) were removed.

5.5.1 Selenium Speciation

Teck has continued efforts to address a challenge in the performance of the WLC AWTF related to selenium speciation in the discharge water. Selenate is the dominant form of selenium in surface waters downstream from Teck's coal mines. At the WLC AWTF, selenium is removed via uptake into microorganisms within the treatment system. One outcome from treatment is that some of the selenium in the treated water is being transformed into different forms of selenium that can be accumulated into the base of the food web more readily than selenate. As a result, although the WLC AWTF has been reducing total selenium loads to Line Creek, recent test results directly downstream of the facility show elevated selenium concentrations in tissues of biota.

In the summer of 2017, Teck completed the successful piloting of an advanced oxidation process (AOP) system that has been identified as a solution to the selenium speciation challenge. The commissioning and operation of a full-scale AOP system at WLC AWTF is planned for August 2018. After the AOP pilot was completed, Teck reduced the flow through the WLC AWTF to 2,500 m³/day and switched from the WLC intake structure over to the Line Creek intake structure in order to minimize potential effects on the receiving environment. These changes resulted in a significant reduction in the total selenium and selenium species concentrations in the effluent. As a result of the reduced treatment, concentrations of selenium and nitrate at the Line Creek Compliance point increased.

On November 29, 2017, Teck submitted an application to temporarily take the WLC AWTF offline in response to the monitoring results that showed a higher proportion of reduced selenium species present in the AWTF effluent and elevated selenium concentrations in aquatic biota collected near the WLC AWTF outfall. This application was based upon an evaluation of the effects of operating the treatment facility in its current state (without AOP) on selenium concentrations in biota, as well as an evaluation of scenarios for operation of the treatment facility during the interim period before the AOP system is brought online. Teck received approval to bypass the WLC AWTF on February 26, 2018 and commenced the temporary shutdown of the WLC AWTF on February 28th, 2018.

Data from the Line Creek Local Aquatic Effects Monitoring Program will continue to be collected and evaluated to understand biological productivity and tissue selenium accumulation downstream from the treatment facility discharge. Learnings from work on this issue will be incorporated into ongoing water treatment activities as the EVWQP continues to be implemented, consistent with an adaptive management approach.

5.5.2 Blank Detection Results

Field blank samples are collected as a method to determine sample contamination during the bottle storage and sample collection/handling process. The results of the WLC AWTF QA/QC program indicated several instances of sample contamination for multiple parameters. WLC AWTF collected 4,069 blank samples, 388 of which had detect results. To identify the source of contamination and reduce the occurrence of blank detection results, WLC AWTF conducted an internal investigation.

To determine the source of contamination effectively, WLC AWTF systematically worked through the potential contamination sources. The following were identified as potential sources of contamination:

- Distilled water used for field blanks lacking sufficient purity
- External lab equipment and/or practices
- Sample handling and processing
- Sample supplies storage

Multiple sets of blanks were taken at WLC AWTF that controlled for potential sources of contamination to identify the source of the contamination. ALS Calgary and ALS Burnaby performed various tests confirming that the quality of water produced at the onsite WLC AWTF lab was not of high enough purity to measure below the detection limits at their labs. This testing also confirmed that there was no contamination occurring at the external lab.

The WLC AWTF lab technician collected multiple sets of blanks eliminating a suspected source of contamination with each set. Blanks were collected using distilled water provided by ALS in the field and in the lab.

The following sampling scenarios were completed to identify potential sources of contamination:

- Filtering using disposable, one-time-use filtering equipment
- Filtering use a re-usable apparatus
- Acid washing the re-usable filtering apparatus before filtering and sampling
- Sampling using bottles stored in different locations (i.e., the WLC AWTF plant and mine site)

Results of the blank detection contamination investigation showed detect results in all blank samples except for the samples that were collected in bottles that had not been stored in the WLC AWTF. Samples were then collected to determine if the contamination occurred only inside the treatment plant or if it extended into the administrative building of the WLC AWTF. The results showed that the contamination of the bottles was isolated to the WLC AWTF.

The location for sample supply storage has been moved from inside of the WLC AWTF to a storage unit outside in an effort to reduce the number of blank detects observed in WLC AWTF field blanks.

6 Linkages to the Adaptive Management Plan

As introduced in Section 1, Teck has developed an Adaptive Management Plan (AMP) to support implementation of the EVWQP, to achieve water quality targets including calcite targets, confirm that human health and the environment are protected, and where necessary, restored, and to facilitate continuous improvement of water quality in the Elk Valley. The following section contains details on how information captured in the surface water monitoring program will be utilized to help re-evaluate the answer to Management Questions 1 and 5 in future AMP reports. Although surface water monitoring is explicitly identified as an input into answering Management Questions 1 and 5, the program contributes information to all Management Questions of the AMP. This section also contains a brief summary of progress made towards developing Early Warning Triggers (EWT) for surface water quality that are being developed as part of the 2018 AMP update process.

Management Question 1 (worded in the 2016 AMP as “Will water quality limits and Site Performance Objectives be met for selenium, sulphate, nitrate and cadmium?”) will be re-evaluated through periodic review of RWQM projections and surface water quality monitoring data. This process is illustrated in Figure 91 below. This report presents a summary of the surface water monitoring program on an annual basis and identifies results of water quality monitoring at Compliance Points and Order Stations with comparison to SPOs, provincial and federal water quality guidelines, and long term trends.

Surface water monitoring will continue as required in permit approvals, furthering information collection regarding the achievement of SPOs in relation to the EVWQP implementation plan and thus supporting the reevaluation of Management Question 1 under the AMP.

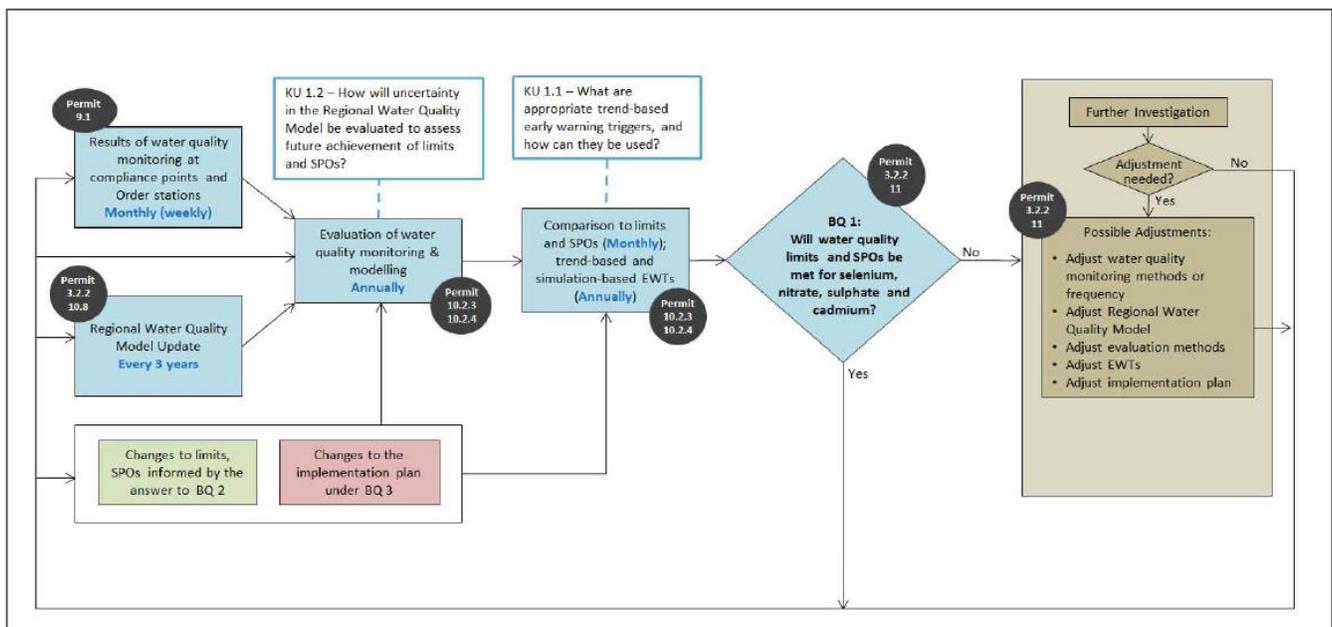

Figure 91. The process for re-evaluating the answer to Management Question 1 (Teck 2016, AMP Figure 6).

Related to Management Question 1, is Key Uncertainty 1.1 (worded in the 2016 AMP as “What are appropriate trend-based early warning triggers, and how can they be applied?”). Key Uncertainties were identified in the 2016 AMP as a means of capturing unknowns or gaps that, once reduced, will improve Teck’s ability to answer a Management Question. Teck has been working with the EMC on developing water quality EWT since the early stages of AMP development. As identified in the 2018 AMP update work, the AMP needs to identify/document key measurement endpoints and relevant screening criteria/trigger levels from existing monitoring programs. Triggers are simply described as a value or criterion for a measurement endpoint which, if reached, instigates action under the AMP Response Framework. In the case of water quality, EWT are being developed to aid in the identification of conditions that are not as expected, with sufficient lead time to allow for management response activities. Through discussions with the EMC, water quality EWT will be developed for the four order constituents (selenium, nitrate, sulphate, and cadmium) where management actions are not already in place or planned and for a list of other identified mine-related parameters (cobalt, lithium, nickel, nitrite, total dissolved solids, uranium, alkalinity, antimony, barium, boron, manganese, molybdenum, and zinc). Development, testing and documentation of water quality EWT are currently in progress. Finalized water quality EWT will be documented in the 2018 AMP update submission and will be evaluated and reported on starting in 2019.

The surface water quality monitoring program as required by Permit 107517 Section 9 provides important supporting information for Teck’s biological monitoring programs. A holistic assessment of Teck’s biological monitoring programs is captured under AMP Management Question 5 (worded in the 2016 AMP as “Does monitoring for mine-related effects indicate that the aquatic ecosystem is healthy?”). The process for evaluating the question is outlined below in Figure 92. Within this process, surface water monitoring data is evaluated with biological monitoring information to determine potential causal effects. If through this process, the answer to Management Question 5 is “No” or “Uncertain”, further investigation is triggered. Similar to surface water, the work related to the 2018 AMP update is also focusing on developing triggers related to biological monitoring information.

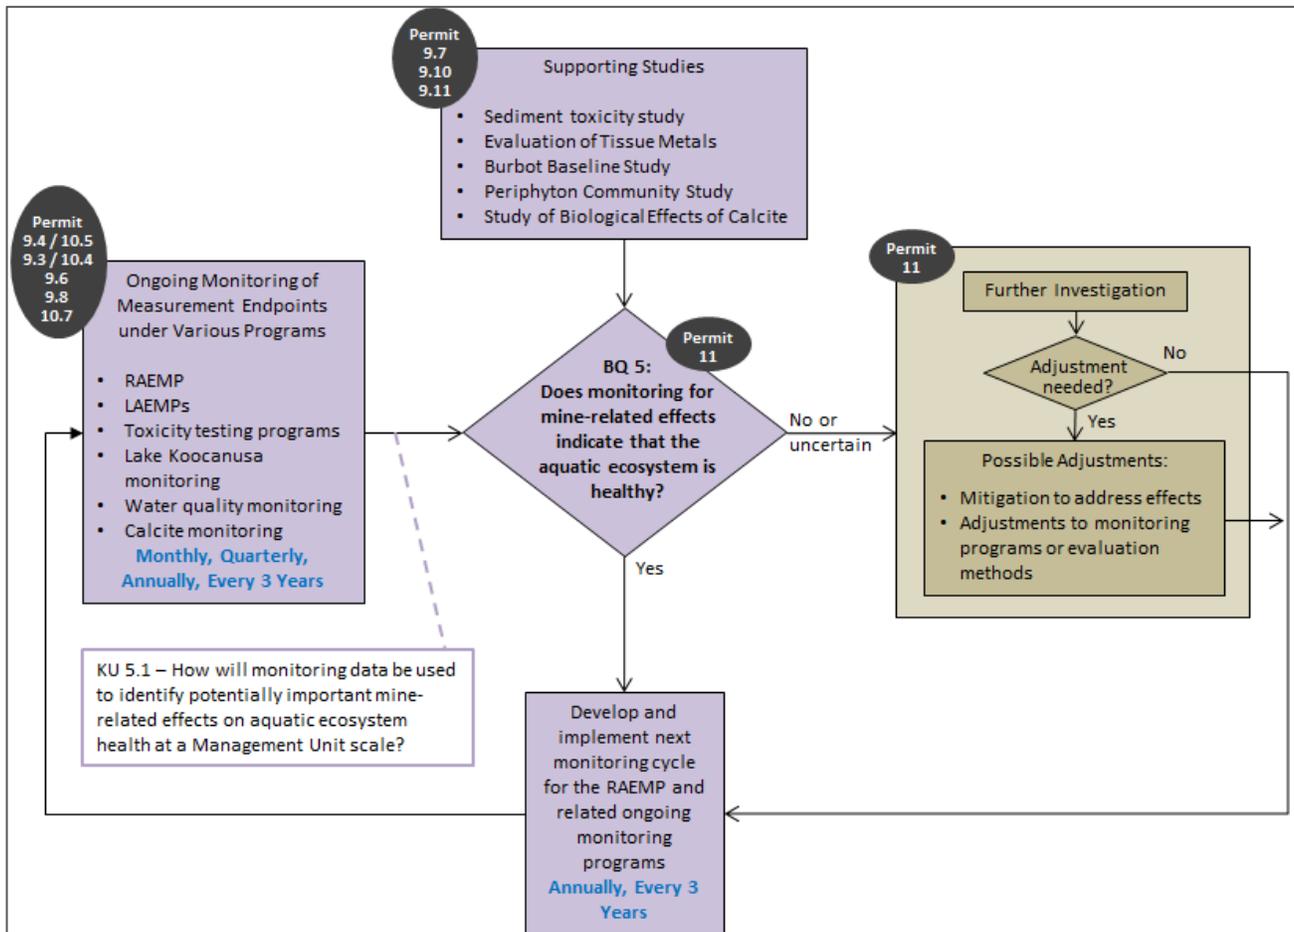

Figure 92. The process for re-evaluating the answer to Management Question 5 (Teck 2016, AMP Figure 18).

7 Discussion

Permit 107517 takes an area based approach to authorizing and managing water quality constituents of interest originating from current and historical mining activities in the Elk Valley. The area based approach requires an extensive surface water monitoring program that includes authorized discharges, receiving environment and other sampling sites, including authorized discharge Compliance Points and Order Stations for which compliance limits or SPOs have been established. These permitted sampling locations are used to evaluate compliance and are a means of tracking effective progression of the EVWQP. The above report is submitted in fulfillment of Section 10.2.4 of Permit 107517 and summarizes the following results from the 2017 calendar year:

- Non-compliances
- Water quality/quantity measurements relative to appropriate compliance limits, SPOs and/or approved and working water quality guidelines
- Toxicity tests
- QA/QC results and issues

There were non-compliances in 2017 associated with Compliance Points E300071 (FR_FRCP1), E297110 (LC_LCDSSLCC), and E258937 (CM_MC2). Permit limit exceedances recorded at Fording River Operations' Compliance Point FR_FRCP1 were for selenium and sulphate. Water quality and quantity monitoring data indicated that surface water at FR_FRCP1 is predominantly discharge water from the mine-influenced Cataract Creek during low flow months. Teck is currently compiling information requested by ENV to support the submission of an application to amend Permit 107517 to move the Fording River Compliance Point to a location that is more suitable for assessing compliance. Submission of the amendment application is targeted for the first quarter of 2018.

Non-compliances associated with Line Creek Compliance Point LC_LCDSSLCC were for selenium and nitrate. As stated in the 2016 annual water quality report, the LCO Compliance Point limits for nitrate were reduced from 14 mg/L (monthly average) and 20 mg/L (daily maximum) to 7 mg/L (monthly average) and 9 mg/L (daily maximum). These changes in limits were initially defined based on modelling that included limited data at this location. Since this time, additional monitoring data indicate that the RWQM did not adequately represent nitrate loadings in Line Creek. In order to improve water quality, Teck has since developed and received approval from the ENV for a nitrate Compliance Action Plan (CAP), which outlines the path forward to support permit compliance for nitrate concentrations in Line Creek. Developed with input from ENV and KNC, the approved CAP identifies objectives, key performance indicators (KPIs), and actions that Teck has taken and will take to reduce nitrate concentrations to support compliance with Permit 107517. The CAP will be updated as required to incorporate learnings from monitoring results and the RWQM update. Despite higher than projected nitrate concentrations in Line Creek as measured at the LCO Compliance Point, nitrate concentrations at the Order Station downstream of Line Creek in the Fording River (FR5, LC_LC5) have remained below the SPO during all periods to date. The selenium non-compliances are a result of Teck reducing the flow rate of the WLC AWTF from 5,500 m³/day to 2,500 m³/day in October 2017 and subsequently limiting the amount of selenium that is removed from Line Creek. Once the AOP is implemented in August 2018, the WLC AWTF will be recommissioned and selenium removal will continue.

The one non-compliance in January of 2017 at the Coal Mountain Compliance Point, CM_MC2, was due to a pit dewatering activity and low winter flows in the discharge and receiving environment. Pumping rates were immediately adjusted to bring nitrate levels back within permit limit. All samples collected since this one incident have been below permit levels.

Non-compliances were also recorded in 2017 associated with *D. magna* acute toxicity testing. Additional investigative studies including TIE indicate that a mineral precipitate forming during lab testing may be causing reduced survival of *D. magna*. The two locations that account for the majority of *D. magna* toxicity test failures in 2017 have treatment (West Line Creek) or are planned for treatment (Cataract Creek) to improve water quality and additional mitigation specific to calcite is being evaluated. Teck is also committed to addressing the issue of precipitate/calcite management in the valley. Identification of priority tributaries for calcite management is complete as per Permit requirements and calcite management permitting is underway.

Other non-compliances were related to missed samples, administrative non-compliances, and hold time exceedances. Improvements in planning (e.g., scheduling of sample collection and shipping

around statutory holidays), internal and external communications (e.g., timely reporting), and following standard protocols are anticipated to reduce future non-compliances.

In consideration of the extensive surface water monitoring program required under Permit 107517, in conjunction with all other active monitoring programs, no additional monitoring is proposed at this time. Data will continue to be evaluated so this monitoring program continues to provide information required to support Teck's AMP.

Table B-16. Monitoring Program Notes and Explanations.

Abbreviations for Surface Water Monitoring Program	
3X/W	Sampling three times per week
C	Continuous Monitoring refer to (f) Table 25
D	Daily frequency
M	Monthly frequency
Ma	Monthly alternative sample location for Swift Creek Sed Pond. Either E221329 or E105061 is sampled, not both.
M/EH	Monthly frequency of one epilimnetic composite of water sampled from three depths (e.g. 1m, 5m,10m) and another hypolimnetic composite of water sampled from three depths (e.g. 20m,32m,45m)
Q	Quarterly frequency
Q*	Toxicity testing done weekly until one year after commissioning is completed, at which time testing must be done quarterly.
SA	Semi-Annual frequency (twice per year), SA sampling schedules must coincide with the monthly sampling schedule for sampling locations where both sampling frequencies are required.
W/M	Weekly frequency March 15 – July 15, monthly during the rest of the year.
BOD	5-day Biochemical Oxygen Demand
EPH	Extractable Petroleum Hydrocarbons, a combination of HEPH (C19-32) & LEPH (C10-19)
TSS	Total Suspended Solids

Table B-17. Monitoring Program Notes and Explanations.

Surface Water Monitoring Program: Explanatory Notes	
a	Field Parameters must include water temperature, specific conductance, dissolved oxygen, pH; for Koocanusa Reservoir locations this includes vertical profiles of dissolved oxygen and temperature
b	Conventional Parameters must include specific conductance, total dissolved solids, total suspended solids, hardness, alkalinity, dissolved organic carbon, total organic carbon, turbidity.
c	Major Ions must include bromide, fluoride, calcium, chloride, magnesium, potassium, sodium, sulphate.
d	Nutrients must include ammonia, nitrate, nitrite, TKN, orthophosphate, total phosphorus.
e	Dissolved Metals Scan must include aluminum, antimony, arsenic, barium, beryllium, bismuth, boron, cadmium, chromium, cobalt, copper, iron, lead, lithium, manganese, mercury, molybdenum, nickel, selenium, silver, strontium, thallium, tin, titanium, uranium, vanadium, and zinc. Total Metals Scan must include aluminum, antimony, arsenic, barium, beryllium, bismuth, boron, cadmium, chromium, cobalt, copper, iron, lead, lithium, manganese, mercury, molybdenum, nickel, selenium, silver, strontium, thallium, tin, titanium, uranium, vanadium, and zinc.
f	Flow monitoring locations may be changed through approved flow monitoring plan and must follow latest approved plan. Flow measurements must be taken in accordance with Section 9.1.2.2 or in accordance with an approved Flow Monitoring Plan.
g	Acute and chronic toxicity tests must coincide with water quality sampling and must be implemented in accordance with the toxicity testing program approved by the Director. Teck shall collect samples when ponds are decanting within the permitted sampling frequency
h	If the discharge point is not decanting to the receiving environment, water quality samples must be taken just inside the decant point for all parameters, with the exception of toxicity.
l (LCO)	Nitrate must be sampled 3 times per week.
m (LCO)	Total Selenium must be sampled 3 times per week.
o (LCO)	Water temperature, dissolved oxygen, pH must be continuously monitored.
r (LCO)	To be sampled only when in use.

1. Introduction

Permit 107517 issued to Teck Coal Limited (Teck) requires that Teck monitor and record surface water discharge values at 36 monitoring locations (Figures 1-5) in the Elk Valley of southeastern British Columbia. Teck records discharge at these stations using multiple approved methods as follows:

- Manual discharge measurements performed by the individual Teck Operations;
- Continuous hydrometric monitoring by the individual Teck Operations;
- Utilizing available Water Survey of Canada (WSC) station discharge data, and
- Calculating discharge values using a combination of WSC and Teck hydrometric station data and scaling the data by drainage area and/or adding/subtracting data.

Kerr Wood Leidal Associates Ltd. (KWL) has been contracted by Teck to review the recorded data, assign grades to the dataset and produce a report documenting the 2017 program.

This report provides an analysis of the 2017 flow year as compared to long term flow records at two Water Survey of Canada maintained hydrometric stations and summarizes instantaneous, continuous and calculated flow data compiled in 2017 to fulfill the Permit 107517 reporting requirements.

2. 2017 Flow Year Context

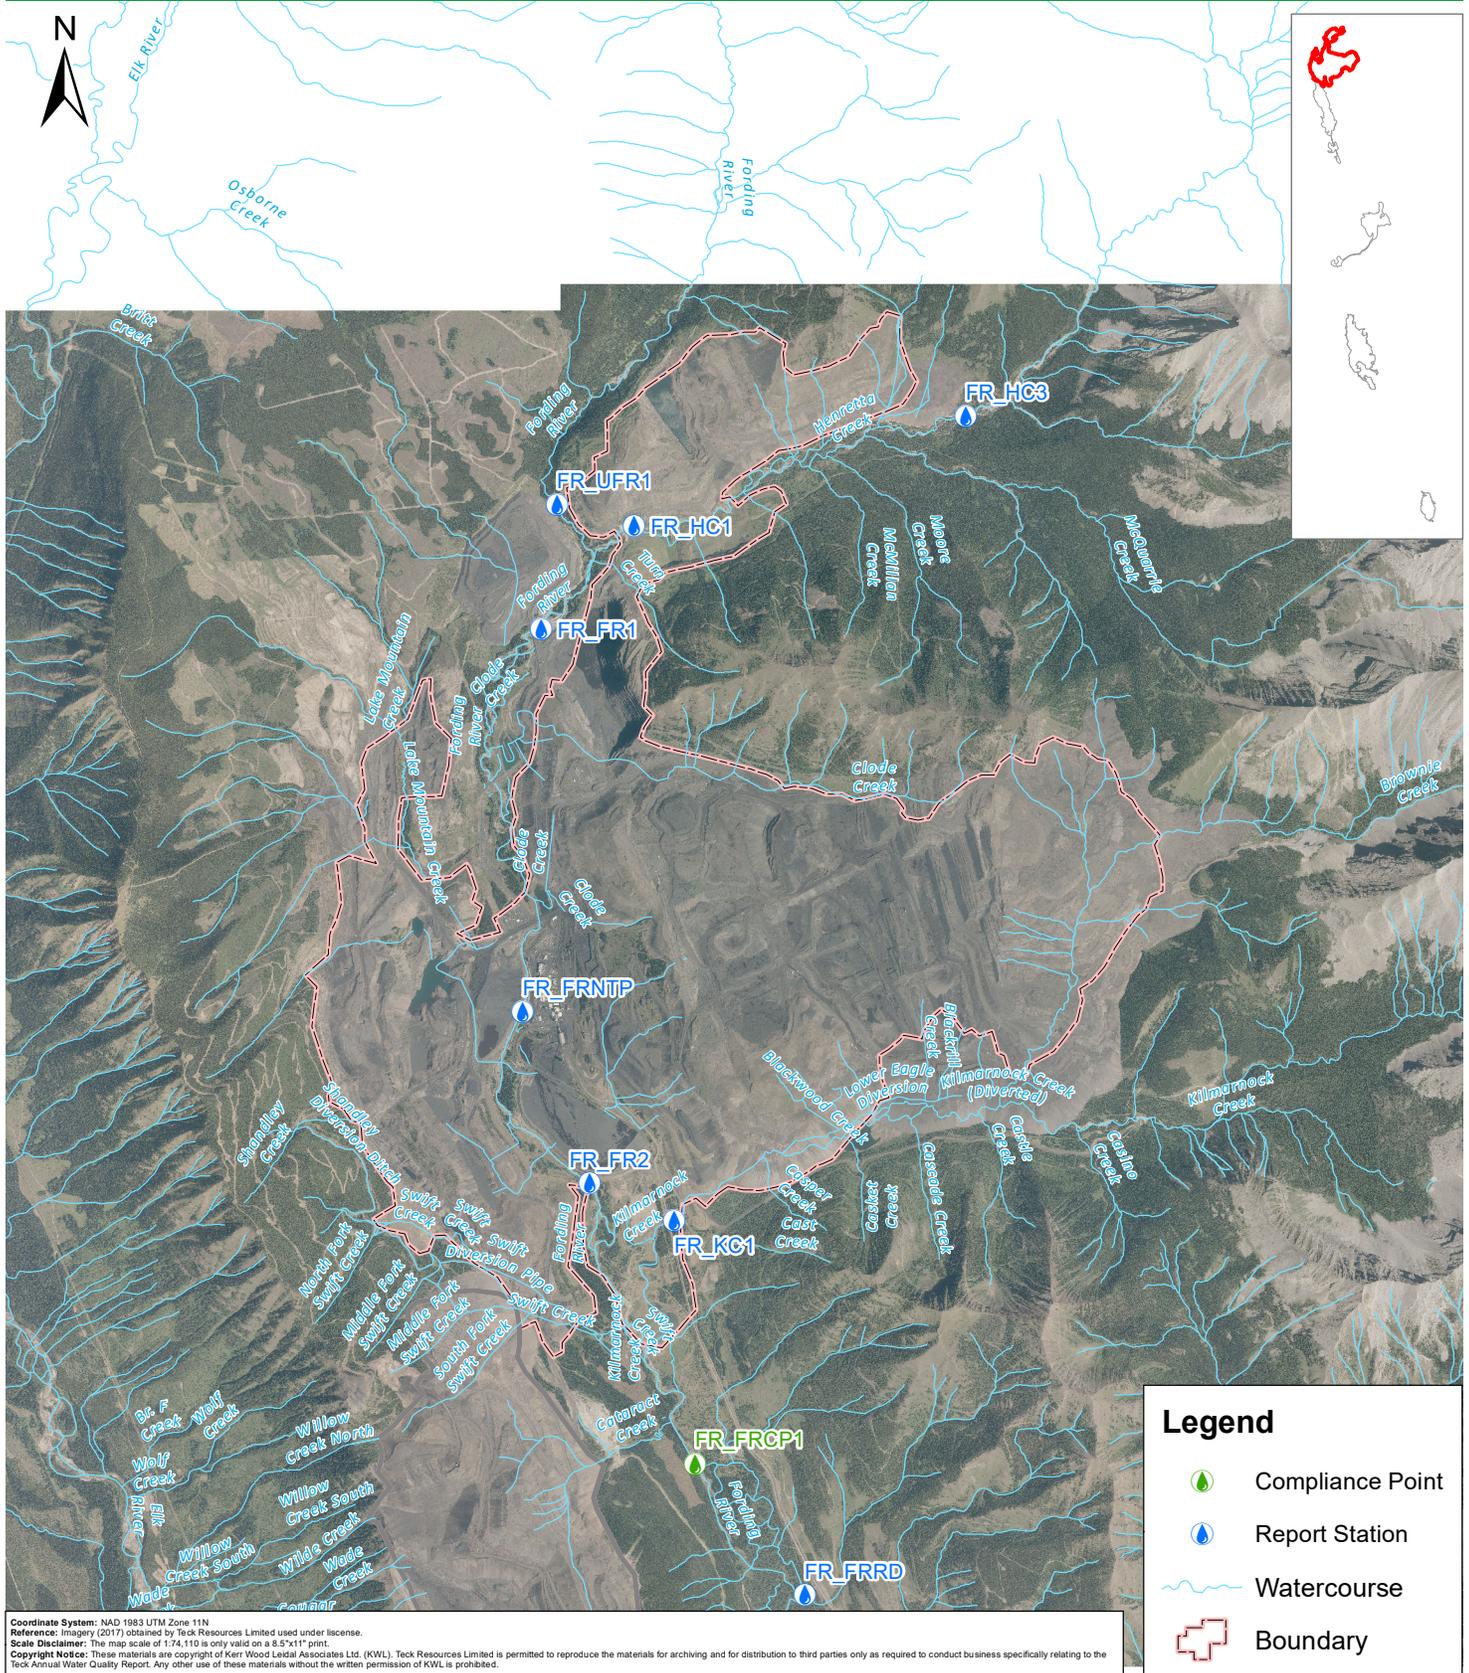

To understand the Teck 2017 flow monitoring year results in the context of the greater Elk Valley hydrology, KWL has compared the 2017 WSC and Environment Canada Elk Valley Station data to historical datasets; the results follow in Sections 2.1 and 2.2.

2.1 Hydrology

The WSC operates two hydrometric stations in the Upper Elk Valley that both have long term historical data records; Elk River at Natal - 08NK016 (1950 -present) and Fording River at the Mouth - 08NK018 (1970 - present). Preliminary 2017 hydrometric data (subject to revision by WSC before final data publication in June 2018) for these two stations were provided to Teck by WSC, and subsequently provided to KWL for analysis.

The 2017 datasets from both WSC stations are compared to the historical data records in Figure 6 and Figure 7. The 2017 data were compared to the historical monthly maximum, minimum and mean for the duration of the record; 2017 data were plotted against the historical monthly averages with the historical maximum and minimums presented as whisker values.

At 08NK016, the winter and spring 2017 discharge data were close to or slightly above the historical mean monthly values and the timing of the 2017 freshet data were close to that of the historical dataset. The 2017 summer and fall monthly average data were well below historical means, close to the historical minimums.

Figure 5

The 2017 data at 08NK018 exhibited a similar pattern to the 08NK016 dataset, although the summer and fall data, while below the historical means, were not as low as the 08NK016 data. The freshet timing at 08NK016 was close to the historical dataset timing.

The 2017 hydrometric year would be characterized as follows:

- January through the start of freshet would be characterized as near normal;
- Freshet would be characterized as near normal (magnitude and timing);
- July through October would be characterized as dry to very dry, and
- November and December would be characterized as near normal.

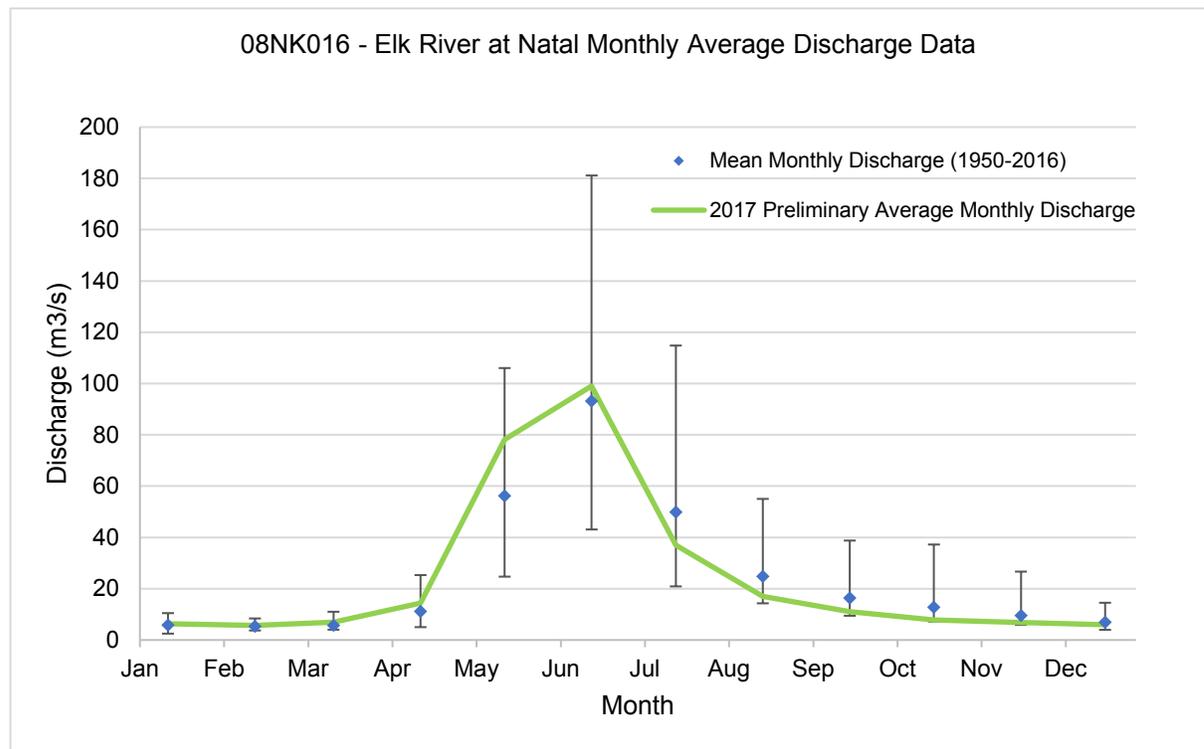

Figure 6: Comparison of 2017 Monthly Average Discharge Values to Historical Elk River at Natal (08NK016) Dataset

(The whiskers on the historical dataset represent the historical mean monthly maximum and minimum values.)

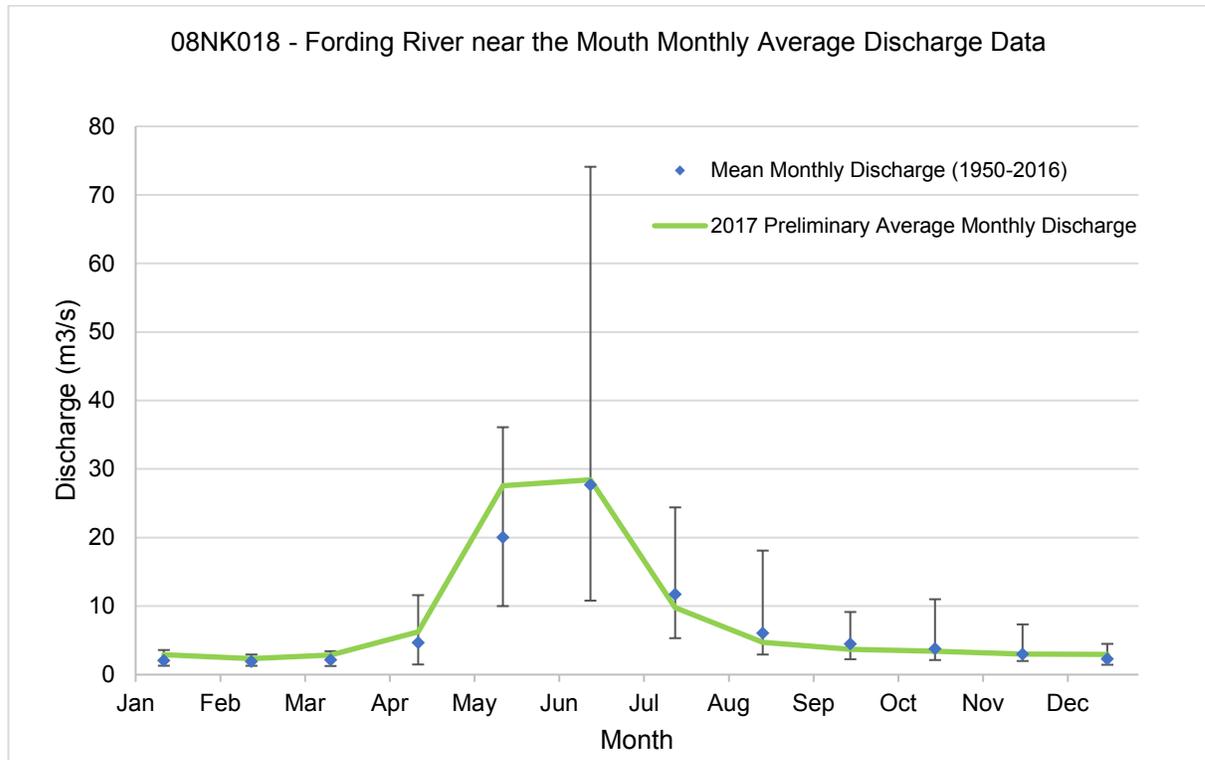

Figure 7: Comparison of 2017 Monthly Average Discharge Values to Historical Fording River at the Mouth (08NK018) Dataset

(The whiskers on the historical dataset represent the historical mean monthly maximum and minimum values.)

2.2 Climate

Environment Canada has operated a climate station at Sparwood, British Columbia since 1980. The historical 1980-2016 dataset was compared with the 2017 dataset, which was downloaded off the Environmental Canada website. The 2017 dataset did not include any recorded precipitation data in January through March and December of 2017 and it is our opinion that this is due to an issue with the station/precipitation sensor rather than at true representation of the 2017 conditions. (This is verified by comparison with the datasets of local Teck climate stations).

Figure 8 presents the 2017 mean monthly precipitation along with the historical dataset. As discussed above, the 2017 dataset does not include precipitation data from January through March and December, therefore this period should not be evaluated. The comparison of the rest of 2017 is as follows:

- April through June 2017 monthly means were below the historical means but above the historical minimums;
- July through September 2017 monthly means were very low, close to the historical minimums, and
- The October and November were closer to the historical mean values.

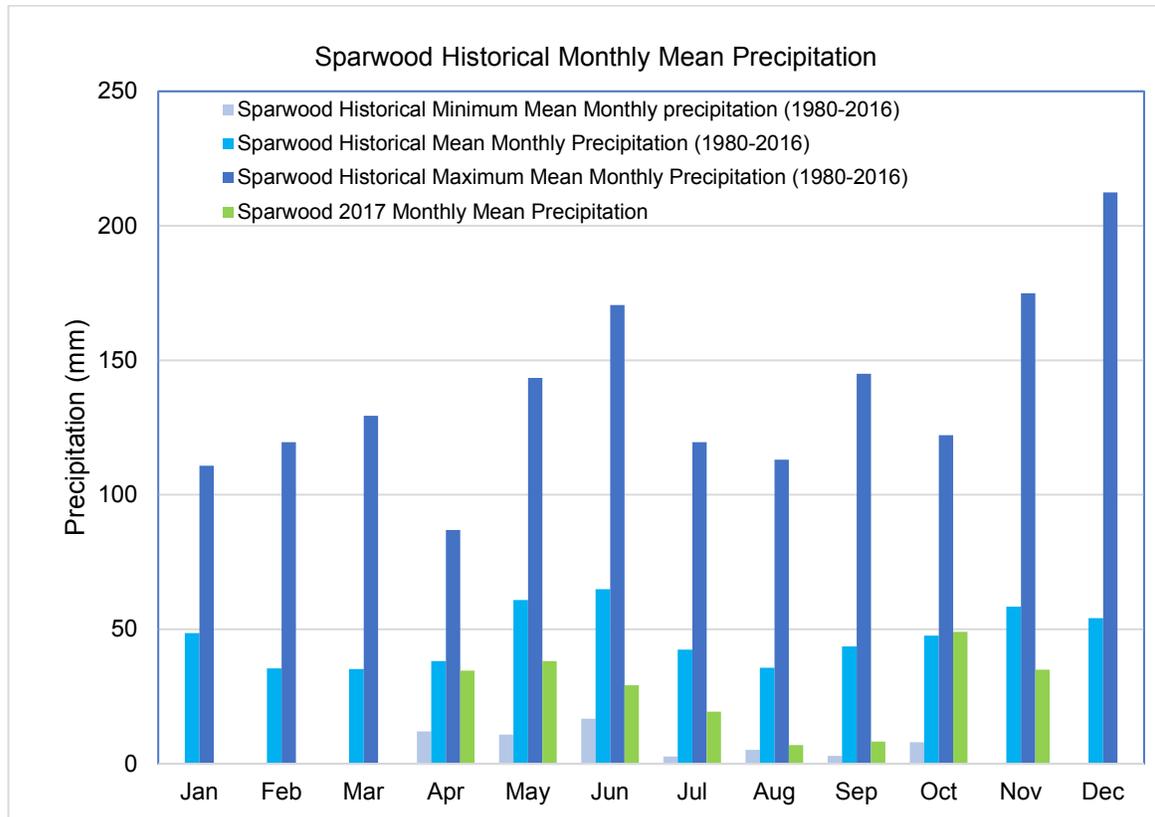

Figure 8: Comparison of the Environment Canada Sparwood Climate Station 2017 and Historical Precipitation Record

Figure 9 presents the 2017 Environment Canada Sparwood Climate station temperature data compared to the station's historical dataset. The 2017 dataset compares to the historical dataset as follows:

- January and February – below average
- March and April – average
- May through September – above average
- October and November – near average
- December – below average

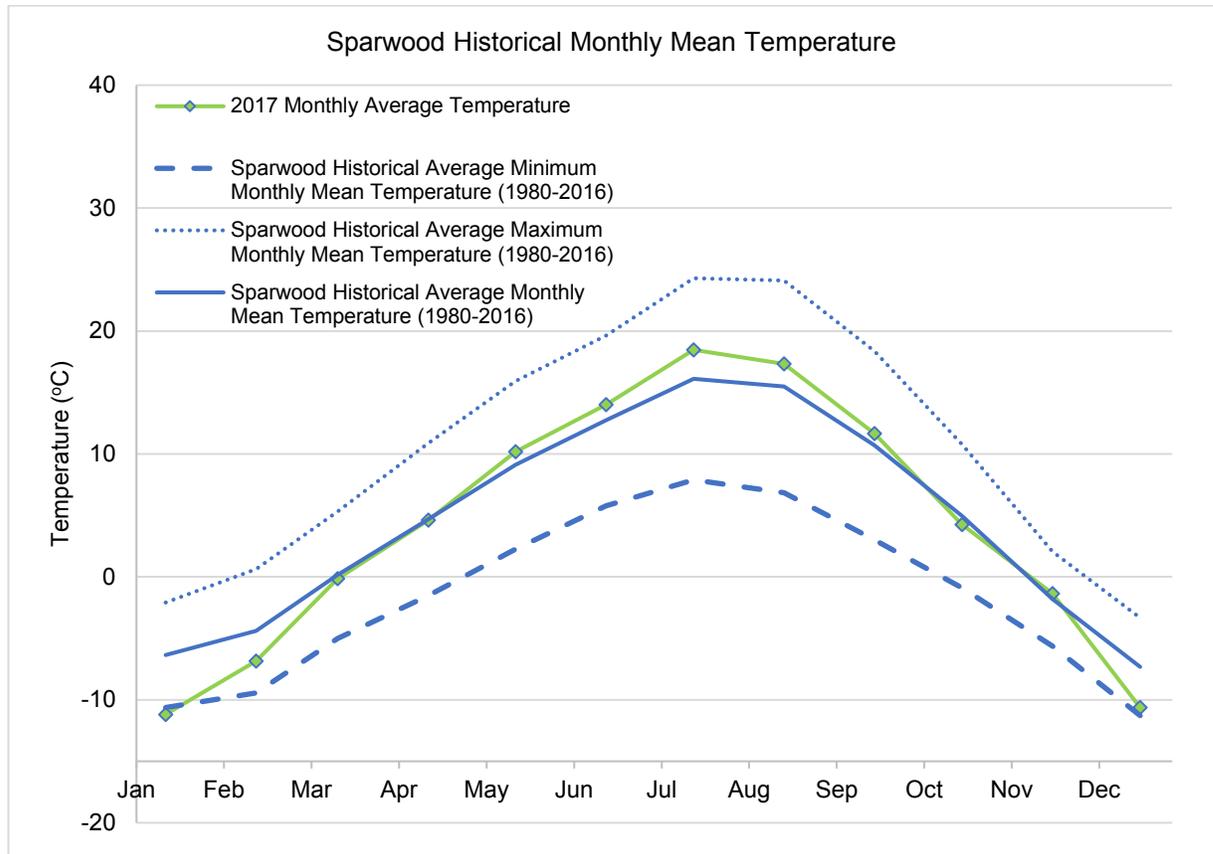

Figure 9: Comparison of the Environment Canada Sparwood Climate Station 2017 and Historical Temperature Record

2.3 Order and Compliance Stations

Teck is required to report data for seven Compliance Stations and five Order Stations; one station (GH_FR1) is included in both datasets. Table 1 presents the 11 stations and the Mean Annual Discharge values for the historical and 2017 datasets.

Table 1: Comparison of 2017 Annual Average Discharge to Mean Annual Discharge at Order and Compliance Stations

¹ W/M = Weekly (March 15 – July 31), monthly during the remainder of the year ² Flow is measured at these locations on a W/M schedule as continuous monitoring is not feasible at these locations. Flow data is collected as per the approved Regional Surface Flow Monitoring Plan at these locations.			

Permit 107517 requires that specific requirements be met when reporting on the annual flow monitoring activities. Table 3 presents the reporting requirements and where each can be found in the report.

Table 3: Permit 107517 Reporting Requirements and Subsequent Locations

Reporting Requirement	Location	Comments
A description of measurement methods, field procedures or data calculations that deviate from the information provided in the Metadata Summary.	Station Summary Report Sheets in Appendices A-H.	A section in the Station Details section of the Station Summary Report reports any deviation from the information provided in the Metadata Summary.
A summary table of the discharge measurements recorded during the year. The summary must include staff gauge measurements, calculated flow values from a stage-discharge rating curve, and manual flow measurements.	Station Summary Report Sheets in Appendices A-H.	The Summary Table of Yearly Discharge Measurements section of the Station Summary Report presents the following: <ul style="list-style-type: none"> • Date of the station visit; • Manual discharge and staff gauge reading values (as recorded); • The calculated discharge values from the stage-discharge rating curve associated with the staff reading; • The difference between the manual discharge measurement and the calculated discharge value; • The percentage difference between the manual discharge measurement and the calculated discharge value, and • A brief description of the measurement technique used.
A hydrograph(s) at a scale appropriate for visually comparing flow values between stations.	Station Summary Report Sheets in Appendices A-H.	A chart that presents the station discharge hydrograph, manual and calculated (from staff gauge readings) discharge measurements, monthly average discharge values is presented on the final sheet of each Station Summary Report.

Reporting Requirement	Location	Comments
A data quality grade for each monitoring station using the Manual of British Columbia Hydrometric Standards (ENV, 2009) methodology, and comparison of the grade to target grades as listed in the Regional Flow Monitoring Program.	Station Summary Report Sheets in Appendices A-H.	<ul style="list-style-type: none"> The target data quality grade for each station is listed in the Station Details section of the Station Summary Report. The Data Quality Assessment - Continuous Data section of the Station Summary Report presents the data grade assigned to the continuous dataset. The Summary Table of Yearly Discharge Measurements section of the Station Summary Report presents the data grade assigned to each manual measurement¹ or discharge value calculated from a staff gauge reading².
In conjunction with the submission of the annual report, final non-continuous flow data will be uploaded to the ENV EMS database while final continuous flow data records and associated rating curves will be provided in Excel format.	Stand-alone Excel file	<p>The file Permit 107517 Data - All Stations is submitted as part of the reporting package.</p> <p>Included for each station is:</p> <ul style="list-style-type: none"> Station EMS ID, Name, Site ID, The continuous dataset in daily average flow values (if applicable), and/or The active stage-discharge relationship equation (as applicable).
<p>Notes:</p> <ol style="list-style-type: none"> Individual discharge measurements are graded based on the RISC Standards for individual measurements. Discharge values calculated from staff gauge readings are graded based on the station's stage-discharge relationship. 		

4. Flow Data Summaries

Each of the stations listed in Table 1 has an Annual Hydrometric Summary Report created for it that includes the following:

- Site naming details (including EMS number, station type, data target grade and rationale etc.);
- Continuous data grade (including missing portions) and description/grade rationale;
- Manual measurement dates, values, grades and description;
- Monthly annual discharge values, and
- A hydrograph that presents all station data.

These summary sheets are presented in Appendices A through H; details of the individual summary sheet locations are found in Table 2.

4.1 Quality Control/Quality Assurance

The 2017 instantaneous flow measurements were generally collected in accordance with Teck's *Flow Monitoring Protocol*¹ (FMP). The protocol outlines standard procedures for flow monitoring and provides information on equipment, measurement approaches, calculations, documentation, and quality control.

As required by Permit 107517, Teck submitted a *Regional Surface Flow Monitoring Plan*² (RSFMP) in 2016, which was updated in 2017 and approved by the Director in February 2018. The RSFMP is an assessment of the suitability of the surface flow hydrometric network to collect the data required at the appropriate frequency and quality to support the range of data uses. This document provides a framework that can be used in the future to reassess Teck's monitoring network in the event of new proposed monitoring locations or data uses.

Most of Teck's continuous hydrometric stations are managed Teck and supported by external professionally qualified consultants. Generally, Teck attempts to collect hydrometric data consistent to the Data Grade assigned by the data use documented in the RSFMP. The individual measurements (collected by Teck and its consultants) are reviewed and then plotted to develop Stage-Discharge Relationships (SDRs) by qualified professionals. The SDRs are reviewed and/or updated annually based on manual flow measurements collected during each year. The data is summarized and submitted to the BC Ministry of Environment and Climate Change Strategy under the *Environmental Management Act*.

Teck also utilizes continuous flow data collected through the WSC hydrometric program. Data quality at these stations is maintained by WSC and the data is used as provided.

Data Grades applied to measurements and data in the summary reports follow the grading system assigned in the *Manual of British Columbia Hydrometric Standards*³ (Generally known as *RISC Standards*). In general, the physical characteristics of Teck's stations can typically support Grade B to Grade C data based on criteria listed in the RISC Standards document. As presented in the RSFMP, at many sites Teck will strive for the Grade B flow standard without adopting continuous water level monitoring (i.e., aim for the accuracy and rigour of Grade B without the installation of a year-round recorder).

¹ Kerr Wood Leidal Associates Ltd. Flow Monitoring Protocol. Report prepared for Teck Coal Limited. June 2017

² Kerr Wood Leidal Associates Ltd., et. al. Regional Surface Flow Monitoring Plan. Report prepared for Teck Coal Limited. October 2017

³ Manual of British Columbia hydrometric Standards, Ministry of Environment, Resources Information Standards Committee. March 2009

The manual measurements are graded on the number of panels included in the measurement, the maximum percentage of total discharge in any one panel, and equipment used independent of the station's overall SDR rating. It is possible for a measurement to be graded B based on the RISC Standards Criteria but plot more than 15% (assumed Grade B accuracy) off the SDR due to any number of factors that may or may not be apparent to or noted by the field staff at the time of measurement. These factors may include instream ice, aquatic vegetation growth, debris in the channel, equipment malfunction, staff gauge reading accuracy or the start of SDR change etc. Similarly, a measurement graded C or E may plot within 15% of the SDR but warrant the assigned grade based on the RISC Standards Criteria. KWL considers these factors when creating the SDR and will exclude a measurement (even if graded B) if it is likely to unduly influence the SDR generation process.

The continuous datasets are graded on more criteria such as: channel condition, the presence of ice, installed equipment accuracy and functionality, number of benchmarks, the number of benchmark checks and data review procedures, etc.

The four stations that have their daily continuous datasets calculated by scaling (by drainage area) other site datasets are all graded E.

Monthly average discharge values for the sites are calculated as follows:

- When a continuous dataset is available the value is averaged for each monthly portion (incomplete months are averaged as if a full month);
- Manual measurements are averaged by month to produce a monthly value (a single manual measurement in one month would equal the resulting monthly average discharge); and
- When a continuous dataset is available for some months it is averaged to produce a monthly value and manual measurements are averaged to produce an average monthly value for the remaining months.

4.2 Hydrometric Network Improvements

Teck has implemented some improvements to its hydrometric network as it relates to the stations identified in Permit 107517. Table 4 provides a summary of the major improvements to Teck's hydrometric network for 2017.

Table 4: Summary of Major Hydrometric Improvements for 2017

EMS ID Number	Site ID	Description of Improvement
E297110	LC_LCDSSLCC	A continuous real-time station was installed at this location in October 2016 and is operated by Teck.
0200028	LC_LC5	WSC upgraded this station with telemetry to have it accessible as a real-time station.
E102709	GH_GH1	A flowmeter was added to the culvert at this location in 2017 to record discharge data.

In addition to the above improvements, Teck is currently completing an assessment of the calculation methods used to estimate flows at GH_ERC, GH_FR1, GH_ER1 and EV_ER1. As part of this process, temporary water level monitors were installed in late 2017 and manual measurements were collected at these locations. The assessment will also require the monitors to be reinstalled for a portion of 2018 with the assessment expected to be complete by the end of 2018. The results of the assessment will provide the suitability of the calculation methods and recommendations for improvements.

5. Calculated Flow Data

Several permitted monitoring stations do not allow the operation of a traditional hydrometric monitoring station due to safety and logistical reasons. The stations that require calculated discharge values are:

- GHO Fording River Compliance Point – Upper Fording River (upstream of Josephine Falls) (EMS 0200378, GH_FR1);
- GHO Elk River Compliance Point – 220m downstream of Thompson Creek (EMS E300090, GH_ERC);
- Elk River Upstream of Boivin Creek (upstream of Fording River) (EMS E206661, GH_ER1); and
- Elk River Downstream of Michel Creek (EMS 0200393, EV_ER1).

In 2015 a protocol was developed by Golder Associates Ltd.⁴ to calculate the monthly average discharge at each of the stations by using WSC or Teck station data as surrogates. KWL has applied this protocol to each of the stations and the data are presented in the following sections.

When applying the flow scaling protocol, it was determined that the preliminary 2017 WSC data had portions of flow (particularly ice affected periods) that would not be considered accurate. Figure 10 shows the ice-affected portions of data that have been removed from the preliminary dataset at 08NK016. Additionally, 08NK022 is missing preliminary data after October 20, 2017. It is assumed that these periods of data will be corrected following the WSC winter data computation process, but that the revised data will not be available in time to include in this report. KWL removed the seemingly erroneous data from the datasets before applying the flow scaling methods.

⁴ Golder Associates Limited, Elk Valley Water Quality Plan Permit and Permit Implementation - Flow Program Support . Report prepared for Teck Coal Limited. March 2015.

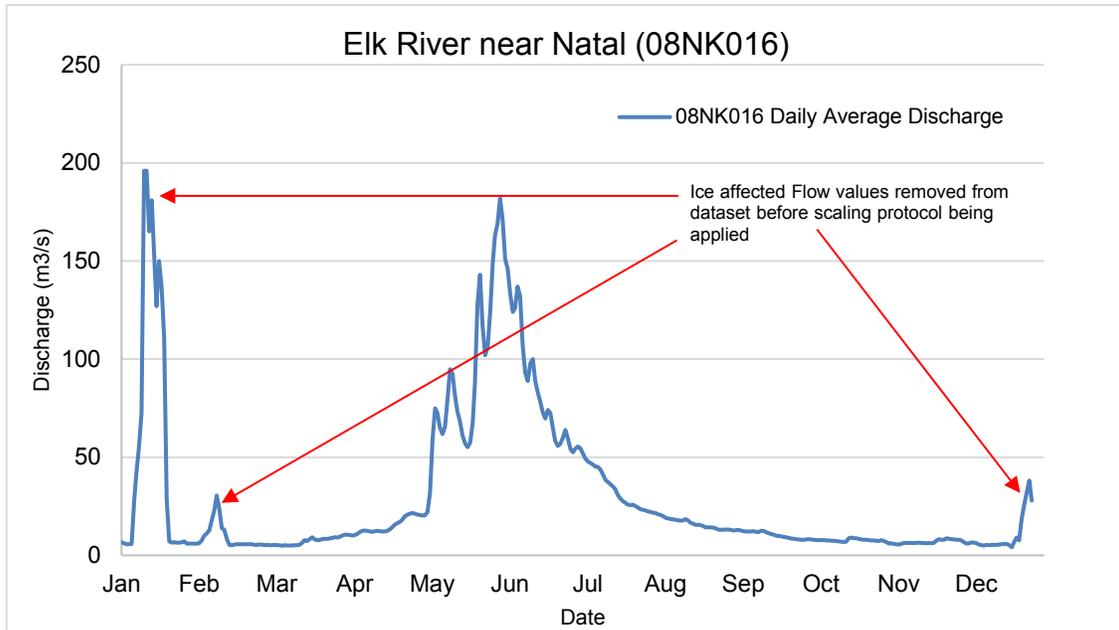

Figure 10: 08NK016 2017 Average Daily Discharge and Removed Values

5.1 GHO Fording River Compliance Point (GH_FR1)

The 2017 monthly average flows for Upper Fording River (upstream of Josephine Falls) (EMS 0200378) are estimated using WSC stations 08NK022 (Line Creek at the Mouth) and 08NK018 (Fording River at the Mouth) data, pro-rated by watershed area (see Table 5 and Figure 11).

The equation used is as follows:

$$\text{Discharge} = (\text{monthly average flow [08NK018]} - \text{monthly average flow [08NK022]}) \times (412 / [619 - 138])$$

Data for 08NK022 were not available beyond October 17, 2017 and therefore monthly average discharge could not be calculated for November and December.

Table 5: GH_FR1 2017 Monthly Average Discharge

Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2017	1.67	1.31	1.82	4.50	17.64	17.20	5.98	2.58	2.16	2.14	-	-

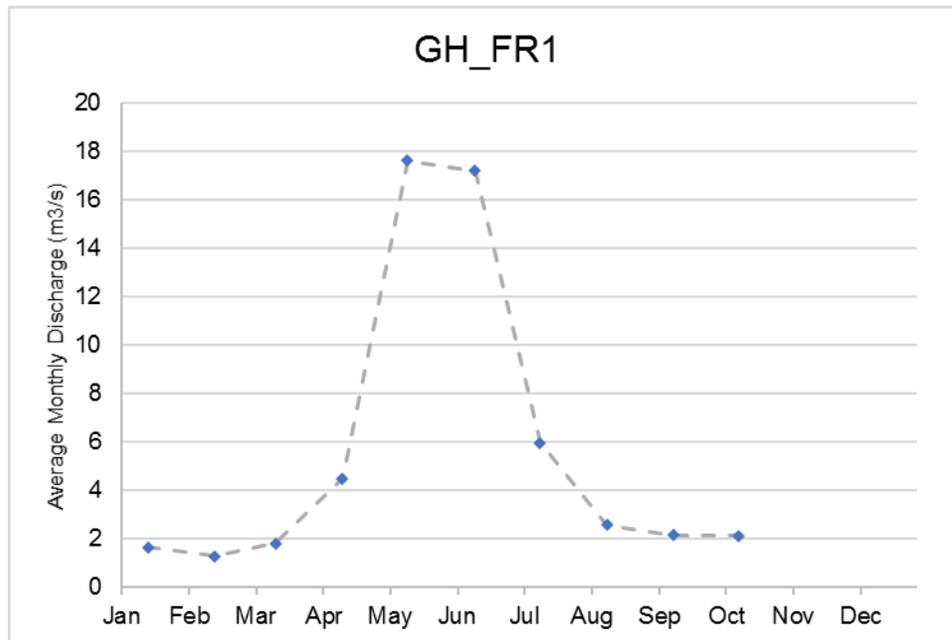

Figure 11: GH_FR1 2017 Monthly Average Discharge

5.2 GHO Elk River Compliance Point (GH_ERC)

The 2017 monthly average flows for Elk River 220 m downstream of Thompson Creek are estimated using WSC stations 08NK016 (Elk River near Natal) and 08NK018 (Fording River at the Mouth) data, pro-rated by watershed area (see Table 6 and Figure 12).

The equation used is as follows:

$$\text{Discharge} = (\text{monthly average flow [08NK016]} - \text{monthly average flow [08NK018]}) \times (903 / [1840 - 621])$$

Table 6: GH_ERC 2017 Monthly Average Discharge

Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2017	2.59	2.38	3.02	6.02	37.48	52.30	20.16	9.09	5.43	3.26	2.82	2.41

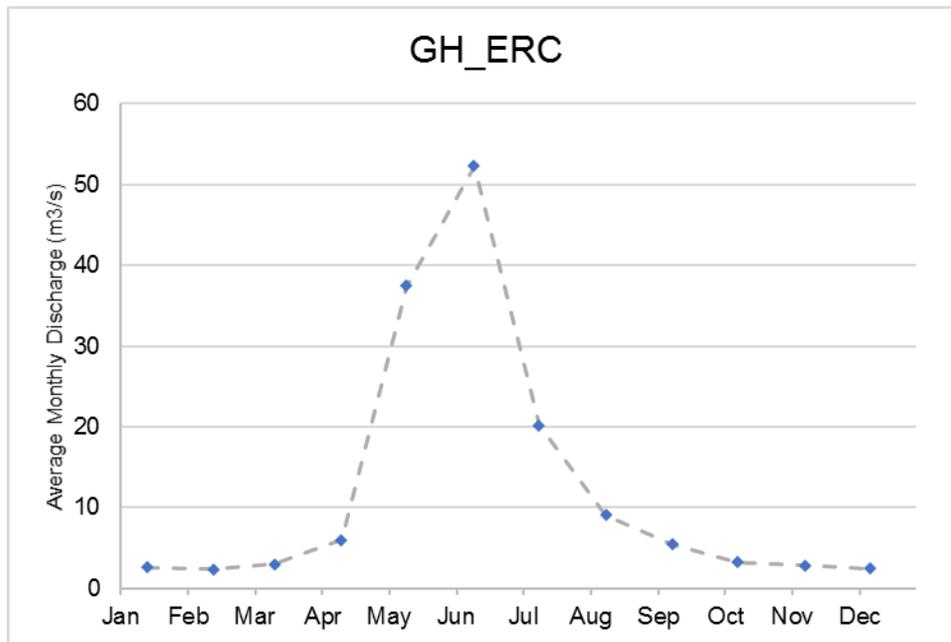

Figure 12: GH_ERC 2017 Monthly Average Discharge

5.3 Elk River Upstream of Boivin Creek (GH_ER1)

The 2017 monthly average flows for Elk River upstream of Boivin Creek are estimated using WSC stations 08NK016 (Elk River near Natal) and 08NK018 (Fording River at the Mouth) data, pro-rated by watershed area (see Table 7 and Figure 13).

The equation used is as follows:

$$\text{Discharge} = (\text{monthly average flow [08NK016]} - \text{monthly average flow [08NK018]}) \times (977 / [1840 - 621])$$

Table 7: GH_ER1 2017 Monthly Average Discharge

Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2017	2.84	2.57	3.27	6.51	40.55	56.58	21.81	9.83	5.88	3.52	3.05	2.60

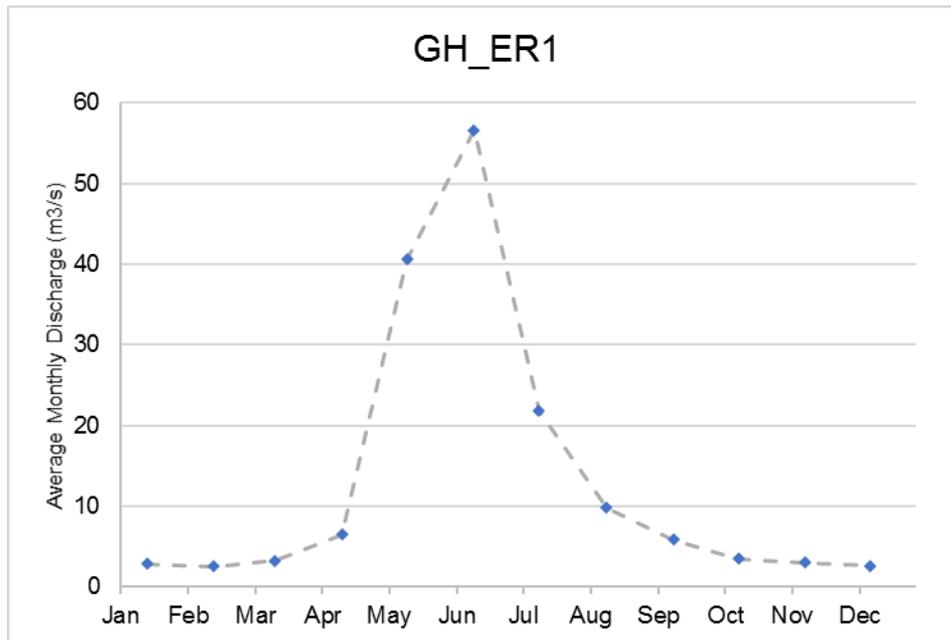

Figure 13: GH_ER1 2017 Monthly Average Discharge

5.4 Elk River Downstream of Michel Creek (EV_ER1)

The 2017 monthly average flows for Elk River Downstream of Michel Creek are estimated using WSC stations 08NK016 (Elk River near Natal) and the Teck Michel Creek at Highway 3 Bridge (EV_MC2) station data, pro-rated by watershed area (see Table 8 and Figure 14). EV_MC2 data was not available for January and February therefore, no monthly average flow was calculated for EV_ER1 during these months. It should be noted that the December monthly average flow value was calculated using only four days of data.

The equation used is as follows:

$$\text{Discharge} = (\text{monthly average flow [Michel Creek at Hwy 3 Bridge]} + \text{monthly average flow [08NK016]}) \times ([2813-637] / 1840)$$

Table 8: EV_ER1 2017 Monthly Average Discharge

Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2017	-	-	19.68	32.27	154.18	164.67	53.22	24.19	16.14	13.40	16.30	17.19

LC_LCDSSLCC 2017 - Yearly Hydrograph

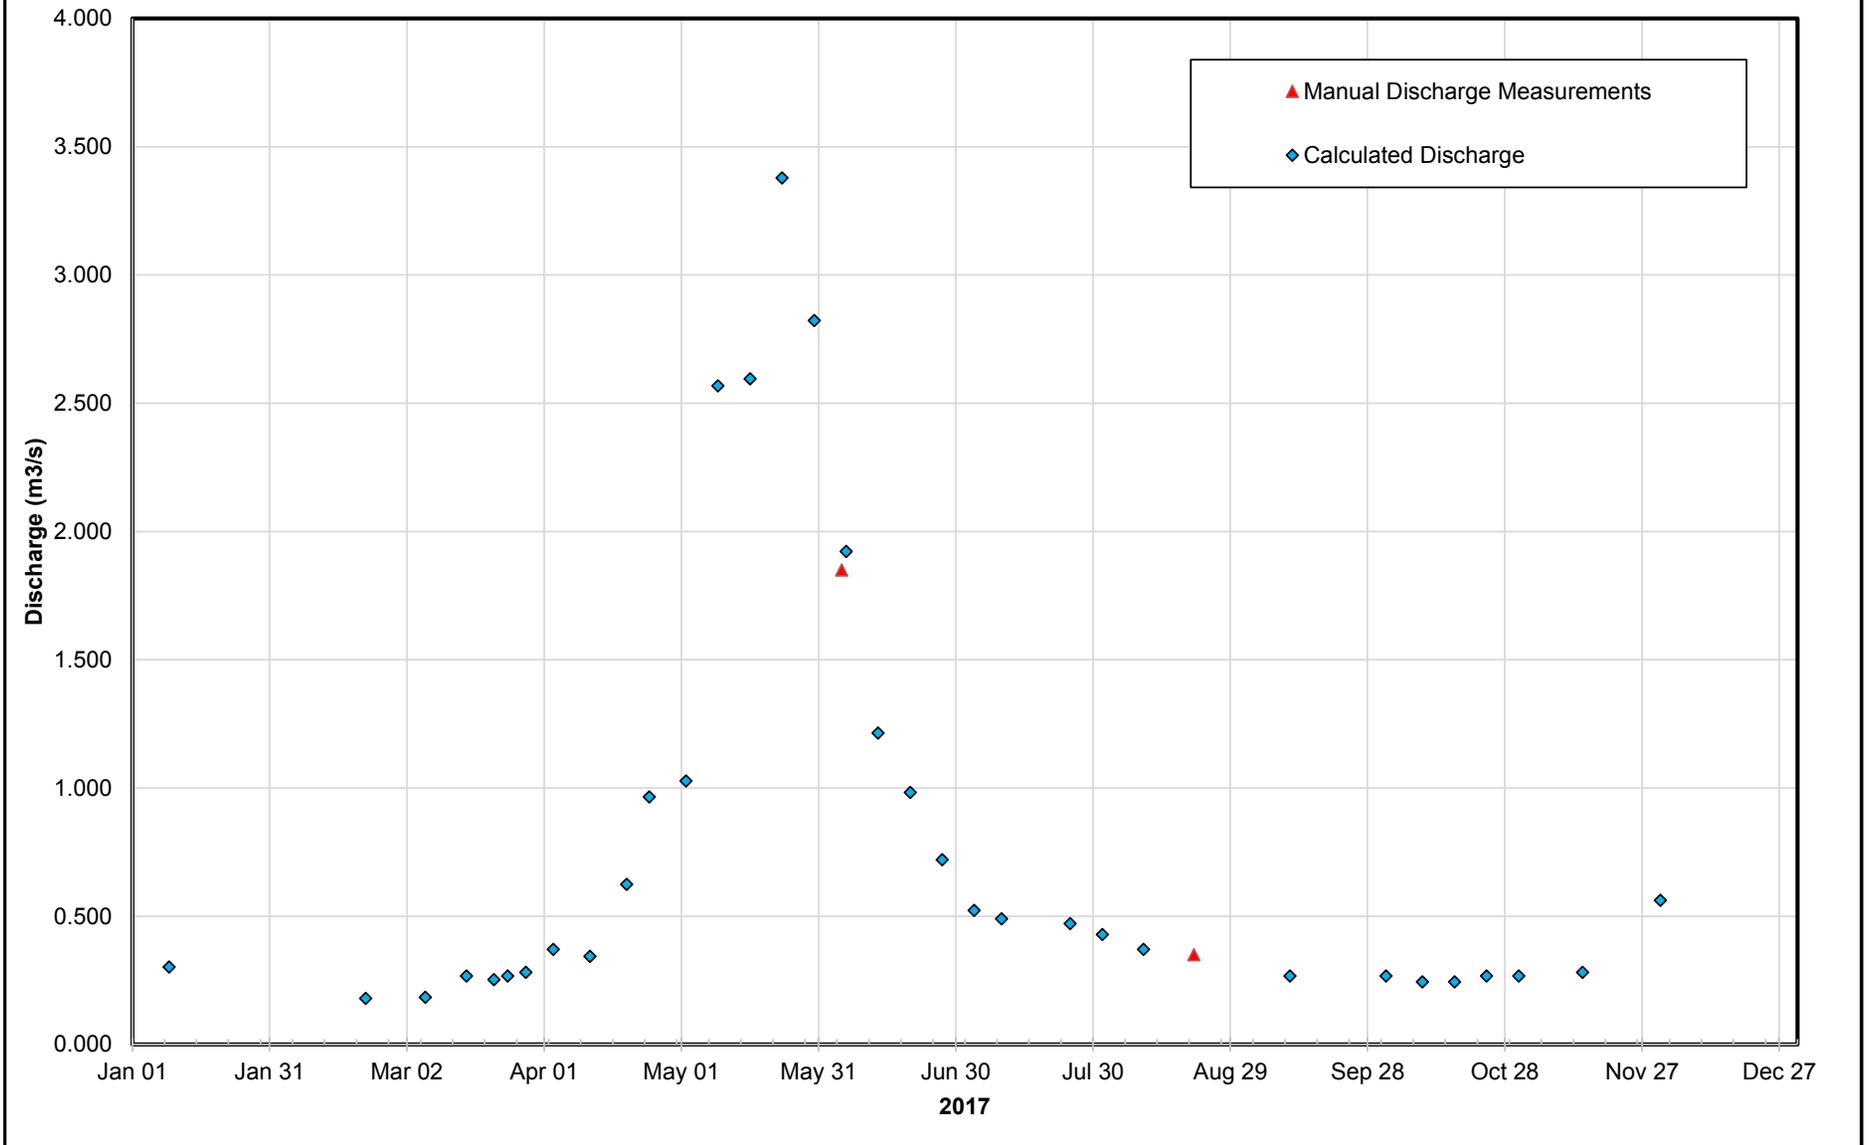

Station Details			
Station Name:	Harmer Creek Dam Spillway	Reporting Year:	2017
Site ID:	EV_HC1	Station Type:	Manual Measurements
EMS:	E102682	Teck Mine:	ElkView Operation
Station Description:	Harmer Creek site is located at the outlet of the Harmer Dam, north of EVO. A staff gauge is located within the concrete spillway which acts as a broad-crested rectangular weir.		
Description of measurement methods, field procedures or data calculation that deviate from the information provided in the Metadata Summary:	All data was collected and managed as per the detail provided in the 2017 Metadata Summary and the 2017 Flow Monitoring Protocol		
Target Data Quality from Regional Surface Flow Monitoring Plan (RSFMP):	B		
Rationale for Data Grade Recommendation (RSFMP)	Governed by MAD and RWQM model data use.

EV_MC2 2017 - Yearly Hydrograph

Station Details			
Station Name:	Michel Cr. D/S CMO near Andy Goode Cr. Junction	Reporting Year:	2017
Site ID:	CM_MC2	Station Type:	Manual Measurements
EMS:	E258937	Teck Mine:	Coal Mountain Operation
Station Description:	Michel Creek Downstream (MC2) is located on Michel Creek immediately upstream of the confluence with Andy Good Creek. The staff gauge is located on the right bank side of the creek on a relatively calm section of the creek about 100 m upstream of the confluence with Andy Good Creek.		
Description of measurement methods, field procedures or data calculation that deviate from the information provided in the Metadata Summary:	All data was collected and managed as per the detail provided in the 2017 Metadata Summary and the 2017 Flow Monitoring Protocol		
Target Data Quality from Regional Surface Flow Monitoring Plan (RSFMP):	B		
Rationale for Data Grade Recommendation (RSFMP)	Governed by MAD and RWQM data use.

FR_HC3 2017 - Yearly Hydrograph

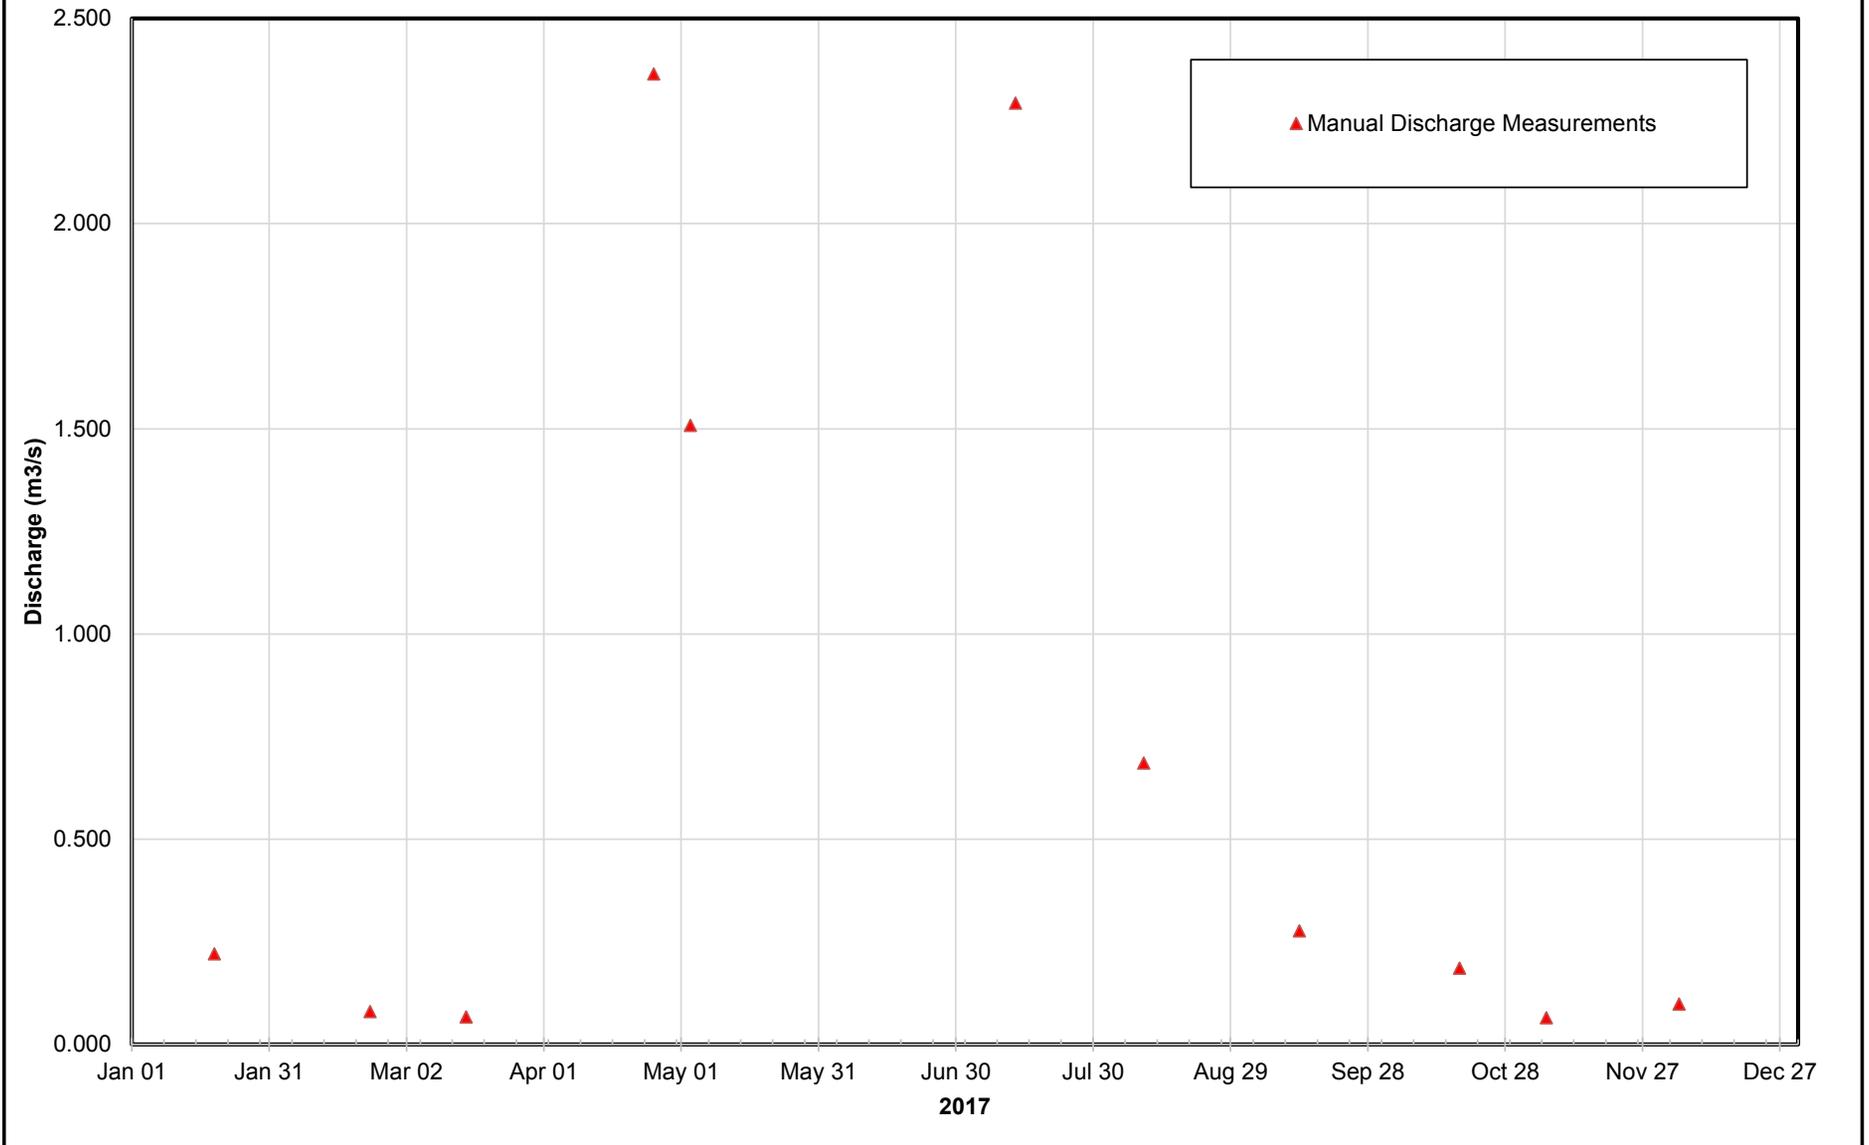

Station Details			
Station Name:	Fording River Near Fording River Road	Reporting Year:	2017
Site ID:	FR_FRRD	Station Type:	Manual Measurements
EMS:	E300097	Teck Mine:	Fording River Operation
Station Description:	Fording River Near Fording River Road		
Description of measurement methods, field procedures or data calculation that deviate from the information provided in the Metadata Summary:	All data was collected and managed as per the detail provided in the 2017 Metadata Summary and the 2017 Flow Monitoring Protocol		
Target Data Quality from Regional Surface Flow Monitoring Plan (RSFMP):	N/A		
Rationale for Data Grade Recommendation (RSFMP)	This site was previously added to the permit as a replacement for FR_FRCP1; however, monitoring at this station does not provide representative Fording River data.

Line Creek Operation Annual Hydrometric Summaries

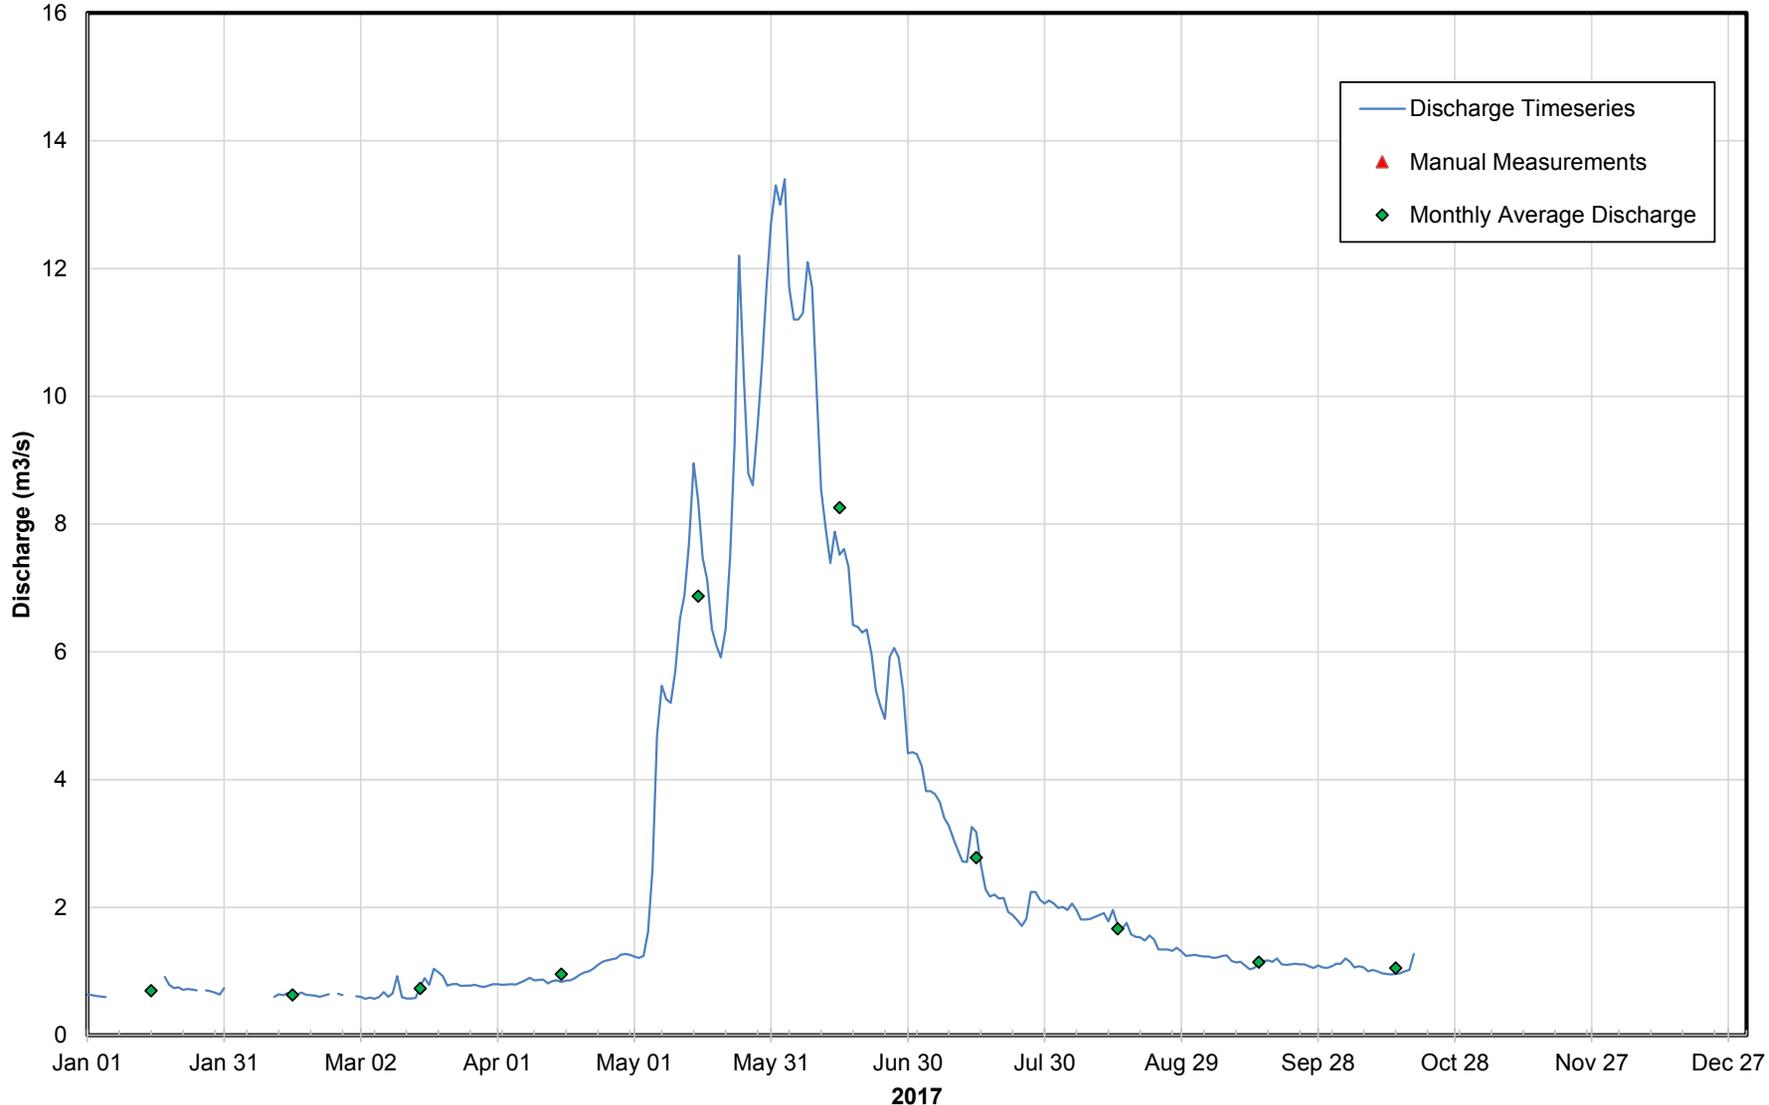

Station Details			
Station Name:	Line Creek U/S of Process Plant	Reporting Year:	2017
Site ID:	LC_LC4	Station Type:	Water Survey of Canada Station
EMS:	200044	Teck Mine:	Line Creek Operation
Station Description:	Water Survey Station Line Creek at the Mouth (08NK022)		
Description of measurement methods, field procedures or data calculation that deviate from the information provided in the Metadata Summary:	All data was collected and managed as per the detail provided in the 2017 Metadata Summary and the 2017 Flow Monitoring Protocol		
Target Data Quality from Regional Surface Flow Monitoring Plan (RSFMP):	B		
Rationale for Data Grade Recommendation (RSFMP)	Governed by MAD and RWQM data uses.		

Data Quality Assessment - Continuous Data		
Data Range	Data Quality Assessment Grade*	Description
January 1 - 5, 2017	B	WSC preliminary data, Grade B
January 6 - 17, 2017	M	Erroneous data removed from preliminary dataset (Ice affected)
January 18 - 25, 2017	B	WSC preliminary data, Grade B
January 26, 2017	M	Erroneous data removed from preliminary dataset (Ice affected)
January 27 - 31, 2017	B	WSC preliminary data, Grade B
February 1 - 10, 2017	M	Erroneous data removed from preliminary dataset (Ice affected)
February 11 - 23, 2017	B	WSC preliminary data, Grade B
February 24, 2017	M	Erroneous data removed from preliminary dataset (Ice affected)
February 25 - 27, 2017	B	WSC preliminary data, Grade B
February 27-28, 2017	M	Erroneous data removed from preliminary dataset (Ice affected)
March 1 - October 19, 2017	B	WSC preliminary data, Grade B
October 20 - December 31, 2017	M	Not available in Preliminary WSC dataset

* Grades A, B, C, E and U based on the BC RISC Standards Document. Data gaps greater than 12 hours categorized as **Missing (M)**, data where ice was present in the stream is categorized as **Estimated (E)**

LC_LC4 2017 - Yearly Hydrograph

Station Details			
Station Name:	Line Cr. D/S of West Line Creek	Reporting Year:	2017
Site ID:	LC_LC3	Station Type:	Year-Round Continuous Data
EMS:	200337	Teck Mine:	Line Creek Operation
Station Description:	LC3 is located downstream of the Line Creek rock drain and the West Line Creek Confluence. The hydrometric station is located above a trapezoidal section of engineered concrete channel.		
Description of measurement methods, field procedures or data calculation that deviate from the information provided in the Metadata Summary:	All data was collected and managed as per the detail provided in the 2017 Metadata Summary and the 2017 Flow Monitoring Protocol		
Target Data Quality from Regional Surface Flow Monitoring Plan (RSFMP):	B		
Rationale for Data Grade Recommendation (RSFMP)	Governed by MAD and AWTF design data uses.		

Data Quality Assessment - Continuous Data		
Data Range	Data Quality Assessment Grade*	Description
January 1 -2, 2017	C	Ice in channel
January 2 - 7, 2017	M	Ice affected data removed
January 7 - 10, 2017	C	Ice in channel, minor ice caused peaks removed
January 10 - 16, 2017	M	Ice affected data removed
January 16 - March 15, 2017	C	Ice in channel, minor ice caused peaks removed
March 15 - September 20, 2017	B	Station performed as expected
September 20 - October 9, 2017	M	Station malfunction
October 9, December 22, 2017	B	Station performed as expected
December 22 - 31, 2017	M	Ice affected data removed

* Grades A, B, C, E and U based on the BC RISC Standards Document. Data gaps greater than 12 hours categorized as **Missing (M)**, data where ice was present in the stream is categorized as **Estimated (E)**

Coal Mountain Annual Hydrometric Summaries

Station Details			
Station Name:	Michel Cr. U/S CMO	Reporting Year:	2017
Site ID:	CM_MC1	Station Type:	Seasonal Continuous Data
EMS:	E258175	Teck Mine:	Coal Mountain Operation
Station Description:	The Michel Creek hydrometric station is located on Michel Creek upstream of mine influence. This monitoring location is used to sample water quality parameters for background levels. The hydrometric station is located on the left side of the channel (looking downstream), south west of the Seven Pit Settling Ponds.		
Description of measurement methods, field procedures or data calculation that deviate from the information provided in the Metadata Summary:	All data was collected and managed as per the detail provided in the 2017 Metadata Summary and the 2017 Flow Monitoring Protocol		
Target Data Quality from Regional Surface Flow Monitoring Plan (RSFMP):	B		
Rationale for Data Grade Recommendation (RSFMP)	Governed by WQ sampling data use.		

Data Quality Assessment - Continuous Data		
Data Range	Data Quality Assessment Grade*	Description
January 1 - May 3, 2017	B	Station operated as expected
May 3 - 5, 2017	M	Data Outage
May 5 - 14, 2017	B	Station operated as expected
May 14 - 16, 2017	M	Data Outage
May 16 - August 13, 2017	B	Station operated as expected
August 13 - 17, 2017	M	Data Outage
August 17 - November 25, 2017	B	Station operated as expected
November 25 - 27, 2017	M	Data Outage
November 27 - December 1, 2017	B	Station operated as expected
December 1 - 6, 2017	M	Data Outage
December 7 - 31, 2017	B	Station operated as expected

* Grades A, B, C, E and U based on the BC RISC Standards Document. Data gaps greater than 12 hours categorized as **Missing (M)**, data where ice was present in the stream is categorized as **Estimated (E)**

Sample Type:	Primary	Secondary

Analyte	Detection Limit Pri.	Detection Limit Dup.	Units			Primary vs. Duplicate	Category1
ACIDITY TO pH 8.3 (As CaCO3)	1	1	mg/l	< 1.0	<1	0.00%	Pass
ALKALINITY, BICARBONATE (As CaCO3), lab measured.	1	1	mg/l	223	226	1.34%	Pass
ALKALINITY, CARBONATE (As CaCO3), lab measured.	1	1	mg/l	< 1.0	<1	0.00%	Pass
ALKALINITY, HYDROXIDE (As CaCO3), lab measured.	1	1	mg/l	< 1.0	<1	0.00%	Pass
ALKALINITY, TOTAL (As CaCO3), lab measured.	1	1	mg/l	223	226	1.34%	Pass
ALUMINUM, D	0.003	0.003	mg/l	< 0.0030	<0.003	0.00%	Pass
ALUMINUM, T	0.003	0.003	mg/l	0.0079	0.0073	7.89%	Pass
ANTIMONY, D	0.0001	0.0001	mg/l	0.00024	0.00024	0.00%	Pass
ANTIMONY, T	0.0001	0.0001	mg/l	0.00026	0.00026	0.00%	Pass
ARSENIC, D	0.0001	0.0001	mg/l	0.00018	0.00018	0.00%	Pass
ARSENIC, T	0.0001	0.0001	mg/l	0.00017	0.00016	6.06%	Pass
BARIUM, D	0.00005	0.00005	mg/l	0.0795	0.084	5.50%	Pass
BARIUM, T	0.00005	0.00005	mg/l	0.0766	0.0792	3.34%	Pass
BERYLLIUM, D	0.00002	0.00002	mg/l	< 0.000020	<2e-005	0.00%	Pass
BERYLLIUM, T	0.00002	0.00002	mg/l	< 0.000020	<2e-005	0.00%	Pass
BISMUTH, D	0.00005	0.00005	mg/l	< 0.000050	<5e-005	0.00%	Pass
BISMUTH, T	0.00005	0.00005	mg/l	< 0.000050	<5e-005	0.00%	Pass

BORON, D	0.01	0.01	mg/l	0.035	0.034	2.90%	Pass
BORON, T	0.01	0.01	mg/l	0.036	0.034	5.71%	Pass
BROMIDE, D	0.05	0.05	mg/l	< 0.050	< 0.05	0.00%	Pass
CADMIUM, D	0.000005	0.000005	mg/l	< 0.000050	1.15e-005	78.79%	Pass-1
CADMIUM, T	0.000005	0.000005	mg/l	0.0000181	1.11e-005	47.95%	Pass-1
CALCIUM, D	0.05	0.05	mg/l	131	126	3.89%	Pass
CALCIUM, T	0.05	0.05	mg/l	124	124	0.00%	Pass
CARBON, DISSOLVED ORGANIC, D	0.5	0.5	mg/l	0.84	0.83	1.20%	Pass
Cation - Anion Balance	0	0	%	0.3	-1.1	200.00%	Fail
CHLORIDE, D	0.5	0.5	mg/l	2.90	2.9	0.00%	Pass
CHROMIUM, D	0.0001	0.0001	mg/l	< 0.00010	0.00012	18.18%	Pass
CHROMIUM, T	0.0001	0.0001	mg/l	0.00017	0.00019	11.11%	Pass
COBALT, D	0.0001	0.0001	mg/l	0.00083	0.00086	3.55%	Pass
COBALT, T	0.0001	0.0001	mg/l	0.00085	0.00094	10.06%	Pass
CONDUCTIVITY, LAB	2	2	us/cm	1010	1000	1.00%	Pass
COPPER, D	0.0005	0.0005	mg/l	< 0.00050	< 0.0005	0.00%	Pass
COPPER, T	0.0005	0.0005	mg/l	< 0.00050	< 0.0005	0.00%	Pass
FLUORIDE, D	0.02	0.02	mg/l	0.098	0.097	1.03%	Pass
Hardness, Total or Dissolved CaCO3	0.5	0.5	mg/l	579	565	2.45%	Pass
ION BALANCE	100	100	%	101	97.8	3.22%	Pass
IRON, D	0.01	0.01	mg/l	< 0.010	< 0.01	0.00%	Pass
IRON, T	0.01	0.01	mg/l	< 0.010	< 0.01	0.00%	Pass
LEAD, D	0.00005	0.00005	mg/l	< 0.000050	< 5e-005	0.00%	Pass
LEAD, T	0.00005	0.00005	mg/l	< 0.000050	< 5e-005	0.00%	Pass
LITHIUM, D	0.001	0.001	mg/l	0.0198	0.0181	8.97%	Pass
LITHIUM, T	0.001	0.001	mg/l	0.0179	0.0168	6.34%	Pass
MAGNESIUM, D	0.1	0.1	mg/l	61.3	60.8	0.82%	Pass
MAGNESIUM, T	0.1	0.1	mg/l	62.1	64.3	3.48%	Pass
MAJOR ANION SUM	0	0	meq/l	12.1	12.2	0.82%	Pass
MAJOR CATION SUM	0	0	meq/l	12.2	11.9	2.49%	Pass
MANGANESE, D	0.0001	0.0001	mg/l	0.00352	0.00358	1.69%	Pass
MANGANESE, T	0.0001	0.0001	mg/l	0.00377	0.00415	9.60%	Pass
MERCURY, D	0.000005	0.000005	mg/l	< 0.000050	< 5e-006	0.00%	Pass
MERCURY, T	0.0005	0.0005	ug/l	< 0.00050	< 0.0005	0.00%	Pass
MOLYBDENUM, D	0.00005	0.00005	mg/l	0.00131	0.00135	3.01%	Pass
MOLYBDENUM, T	0.00005	0.00005	mg/l	0.00137	0.0014	2.17%	Pass
NICKEL, D	0.0005	0.0005	mg/l	0.0142	0.0146	2.78%	Pass
NICKEL, T	0.0005	0.0005	mg/l	0.0140	0.0147	4.88%	Pass
